Dear Samsung Food team,

I am applying for the Staff Product Manager role on the AI coaching capability in Samsung Health. The problem you are solving, defining what an AI coach says and when it stays quiet, is one I find worth doing carefully. Getting that silence decision wrong is as harmful as getting the coaching wrong, and I have not seen many teams think about it that way. That framing in the posting is what made me want to apply.

My background is 13 years of product ownership across regulated and technically complex environments: defence AI platforms, national public-sector analytics, insurance SaaS, healthcare mobile apps, and fintech. Each of those required turning ambiguous briefs into buildable definitions for cross-functional teams, often across organisational and geographic boundaries. At Rohde & Schwarz I owned the product definition for an AI and data platform serving multinational engineering teams across the FCAS European programme, writing specs and decision logic that distributed teams in multiple countries could work from without daily hand-holding. At CLINET I cut a roadmap to its top 10% against agreed success criteria and took user acceptance up more than fivefold, that kind of scoping decision, accepting first-release limitations in exchange for a coherent experience, is exactly what the coaching MVP will need.

The AI product context requirements in the posting match where I work today. I design systems around what information reaches a model, when it reaches it, and what constitutes an acceptable answer. I have shipped LLM agent workflows, written evaluation loops for output quality, and prototyped coaching-style interaction models using Claude Code and Lovable. I know the gap between "the model can do this" and "the product should do this," and I work on that gap deliberately.

Working across Samsung's teams in Europe, Asia, and North America is a coordination challenge I have navigated before, and I understand the additional layer that platform constraints, parent-company review processes, and regulatory requirements add to every release decision. I do not treat those as blockers; they are part of the product definition.

I am available as an independent contractor, based in Berlin, and ready to start on short notice.

Best regards, *Philipp Hilbert*
