---

Dear Unit4 hiring team,

Resource planning problems are hard not because the logic is complex in isolation, but because the people, priorities, and constraints involved are always moving. I have spent the better part of a decade untangling exactly this kind of operational messiness – across a multinational defence programme, a public sector labour market analytics platform, and a B2B InsurTech product serving primary insurers, reinsurers, and brokers simultaneously. Each of those environments required translating dense, multi-stakeholder workflow logic into dev-ready requirements that teams could actually deliver against. That translation work is the core of what I do well.

At Rohde & Schwarz, I was the sole Product Manager on a government-contracted AI and data management platform for the FCAS programme, responsible for full-cycle delivery across a cross-functional team of architect, data scientists, and frontend and backend engineers. I introduced GitOps practices that cut deployment times from several days to under forty minutes, and I independently unblocked an infrastructure-level issue in OpenShift that the project lead had been escalating to engineers for over a year – delivered in one week. The pattern there was not heroics; it was systems thinking applied to a delivery bottleneck, which is what product work actually demands at the engineering seam.

At Emil Group, I inherited a 17-person scrum team in near-collapse – client trust broken, sprint discipline gone, senior engineers leaving. I split the team into smaller focused units, re-introduced velocity tracking, structured refinement, and ownership concepts, and ran weekly product workshops to rebuild transparency with the client. We went from near-total senior attrition to a single departure over the subsequent months. The Claims Center module I designed and delivered in that period went from concept to production rollout during one of the most turbulent periods the team had faced. Delivery stability is not accidental; it is a product discipline.

The Resource Planning domain at Unit4 is one I approach with genuine curiosity and honesty about the learning curve. I have not owned a dedicated workforce scheduling or PSA product before. What I do bring is a decade of decomposing operationally complex, multi-stakeholder processes – labour market forecasting at the federal level, clinical patient flow at the hospital level, policy issuance and underwriting at the insurer level – and turning them into software that users actually adopt. Resource allocation logic is, at its core, a constraint-satisfaction problem with a human layer on top. I have been living in that space under different domain labels for years.

Unit4's stated purpose – improving how people work by focusing on what truly matters – is not marketing language I can dismiss. It describes a real product philosophy, and it is one I recognise from the kinds of product decisions I have valued in my own work: fewer features with sharper impact over more features with diffuse coverage. I would like to contribute that thinking to the Resource Planning domain and help Unit4's mid-market customers spend less time managing their workforce tools and more time on the work that actually matters to them.

Best regards, *Philipp Hilbert*
