Dear Climatiq team,

I am applying for the Senior Product Manager, Data and API role because the product problem is one I have been solving, under different labels, for nearly a decade: how do you build a data platform that domain experts trust, that engineers can integrate reliably, and that holds up under regulatory and scientific scrutiny? At Climatiq, that question has a concrete answer with real-world consequence – every emission factor served through the API either advances or undermines a corporate climate commitment. That stakes profile is one I take seriously.

At Rohde & Schwarz, I owned the data management platform for the FCAS defence programme – a context where data provenance, reproducibility, and auditability were not nice-to-haves but contractual requirements. I introduced transformation pipelines with full audit trails, implemented SafeAI and ExplainableAI concepts alongside data scientists, and delivered features end-to-end including user stories, acceptance criteria, implementation support, and GitOps-based rollout with ArgoCD. That experience maps directly to what Climatiq needs from a PM who partners with LCA experts on methodology development: the discipline to track where data comes from, what transformation was applied, and how to surface that transparently to the end user.

At the Federal Employment Agency, I owned the Arbeitsmarktmonitor analytics platform – a public-facing data product consumed by policymakers and regional planners who needed to trust what they saw. I introduced Dagster for automated ETL and indicator generation, worked with dbt and DuckDB for data modelling, and served as Deputy IT Security Officer with responsibility for compliance and data lineage. Managing a data product where the underlying calculations are scrutinised by expert users is the same discipline as managing an emissions database where climate scientists and corporate sustainability teams need to rely on the numbers. I know how to hold that trust while still shipping.

On the API side, I have worked across integration-heavy products throughout my career – from CGM hospital information system integrations at CLINET Platforms to REST API design in InsurTech at Emil Group – and I understand that an API product is not just an endpoint but a contract with the developers who build on top of it. Versioning discipline, clear error semantics, backward compatibility, and integration documentation are product decisions, not just engineering ones.

I am Berlin-based, an EU citizen, and available on four weeks' notice. I would welcome the chance to talk through how my background maps to where Climatiq's data and API platform is heading.

Best regards, *Philipp Hilbert*
