

Philipp Hilbert. *Decision engine builder who ships.*

Positioning, ten years translating complex operational workflows into scalable software systems, now ready to own Taktile's core decisioning layer. ≤ 25 words.

Taktile's Decision Engine sits at the operational core of every lending approval, fraud check, and AML workflow your customers run. When that layer has gaps – in workflow clarity, in auditability, in reliability under load – the downstream cost is not a product complaint but a rejected borrower, a missed fraud signal, or a compliance finding. I have spent nearly a decade working on exactly that category of problem, and I want to bring that experience to bear on Taktile's decisioning platform.

At Rohde & Schwarz, I owned the AI data management platform for the FCAS European defence programme. The core challenge there was not building features – it was building a system that other systems could trust: reproducible data transformation pipelines, full data provenance and audit trails, and SafeAI evaluation concepts that made model decisions legible to multinational stakeholders. I delivered this end-to-end, from user stories through implementation support and GitOps-based rollout, and I unblocked infrastructure-level blockers in OpenShift independently – one week to deliver a feature that had been stuck in the backlog for over a year. That combination of product ownership and technical depth is what I would bring to the Decision Engine.

At the Federal Employment Agency, I took ownership of the Arbeitsmarktmonitor – an analytics platform for regional labour market data used by policymakers and researchers. I introduced Dagster for automated ETL, migrated legacy systems to Kubernetes, standardised CI/CD with full test integration, and served as Deputy IT Security Officer with accountability for compliance and data lineage. This role sharpened my understanding of what it means to own a platform that underpins critical decisions at scale, where data quality and system reliability are non-negotiable.

Earlier, at Emil Group, I stepped into a prototype-stage InsurTech B2B SaaS environment where delivery had broken down, client trust was eroding, and a 17-person team was moving without ownership or structure. I split the team into smaller Scrum units, reintroduced velocity tracking and structured refinement, and led weekly product workshops that rebuilt client confidence. Reducing senior developer attrition from near-total to a single departure was a direct

consequence of restoring clarity and discipline. That experience taught me that platform reliability is as much a product and process problem as a technical one – and that the PM is accountable for both.

I am based in Berlin, fluent in German and English, and ready to operate with the autonomy and ownership your role description outlines. The opportunity to define what agent-first decisioning looks like in financial services – working alongside the engineering team, close to customers like Mercury and Monzo, and grounded in real production constraints – is exactly the scope I am ready for.

Best regards, *Philipp Hilbert*
