

Philipp Hilbert. *Payment systems product leader turned collection experience architect.*

Positioning, ten years owning complex payment and workflow products end-to-end, now ready to make debt resolution as frictionless as modern checkout.

Dear Riverty hiring team,

Debt resolution is one of the few financial product categories where the experience design directly determines the outcome – not just user satisfaction, but recovery rates. Riverty's Human Centric Collection strategy is a genuine product bet on that claim, and the fact that you are investing in scalable, automated, self-service payment infrastructure to back it up suggests the organisation is willing to do the hard systems work, not just the brand work. That is why this role caught my attention.

My background is in payment and workflow product management in regulated environments. At Kvitt Payment Solutions, a company I founded and built from zero, I designed and shipped a group-based P2P payment product including PSP integration, consumer payment UX, and all the edge-case handling that entails – before it was acquired and taken over by Sparkasse. At Emil Group I owned an InsurTech SaaS platform where the core challenge was exactly what this role describes: translating complex regulatory and operational requirements into configurable, scalable modules that different client types could apply independently, without engineering involvement. I rebuilt sprint discipline, split a bloated team into accountable Scrum units, and regained client trust through structured product communication. The mechanics of that work – modelling decision logic, exposing configuration surfaces, reducing manual process steps – transfer directly to the Installments and Payments domain.

My more recent roles have sharpened the data and automation side. At the Federal Employment Agency I introduced Dagster for automated ETL and indicator generation on a public analytics platform, served as Deputy IT Security Officer, and standardised CI/CD across the stack. At Rohde and Schwarz I owned a data management platform inside the European defence programme FCAS, reduced deployment times from several days to under forty minutes by introducing GitOps with ArgoCD, and delivered autonomous feature sets end-to-end –

requirements through implementation through rollout. I bring genuine technical fluency, not just the ability to relay requirements between business and engineering.

On the AI and automation side, I work daily with Claude Code, GitHub Copilot, n8n for multi-agent workflow design, and rapid prototyping tools including Lovable and Framer. I treat these as real execution tools, not capability signals. When the job description refers to KI-gestützte Entscheidungen as part of future-proofing the payment product, I have a concrete idea of what that means in practice – automated decision routing, configurable scoring thresholds, audit-ready output – because I have shipped adjacent systems.

I am based in Berlin, speak German as a native language, and work at C2 level in English across written and verbal communication. I am available to start within four weeks of an offer. I would welcome the opportunity to discuss the specifics of your current payment journey challenges and how I might contribute.

Best regards, *Philipp Hilbert*
