Dear Crypto.com Hiring Team,

Trading is where users feel a crypto product every day. A slow order entry, an unclear liquidation warning, or a funding-rate display that takes three taps to find are not UX nits, they are retention events. I have spent the past eight years as an active participant in crypto markets across Hyperliquid, Bitget, Jupiter, and 1inch, and the past several years studying market microstructure: slippage, price impact, routing quality, and liquidation heatmaps via Coinglass and Hyblock Capital. I trade perpetuals and spot. I run backtests on real execution data. I understand the difference between what a trader says they want and what their order history reveals they actually need. That is the user research lens the Senior Product Manager, Trading role calls for.

On the product side, I bring 13 years of end-to-end ownership in regulated, high-stakes environments. At Rohde & Schwarz I ran a cross-functional team of 15+ engineers and data scientists, restructured the roadmap based on instrumented workflow analysis, and cut platform rollout time from days to 30 minutes through GitOps delivery with ArgoCD. At the Federal Employment Agency I carried a full ETL migration, a UI relaunch, and container migration in parallel while serving as Deputy IT Security Officer, the kind of multi-dependency coordination the trading charter requires across Engineering, Design, QA, Analytics, Marketing, and Compliance. Earlier, at EMIL Group, I took over an 18-person delivery organisation that was losing its senior engineers and its client trust, restructured it into three lean teams, and shipped the Claims Center from concept to production. I know what cross-functional alignment looks like when it is genuinely stalled, not just slow.

The fintech and payments thread runs deeper than the CV headline. Kvitt Payment Solutions, the P2P mobile payments startup I co-founded, was acquired and operated by Sparkasse inside the girocard ecosystem, a regulated, consumer-facing financial product taken from zero to acquisition. The AI-native workflow requirement in the posting is not a checkbox for me: I use Claude Code, Cursor, Lovable, and n8n daily for spec generation, prototyping, and agentic workflow automation. I also build my own crypto dev agent framework and a backtesting engine, which means I can work alongside your engineering team with genuine technical context rather than as a translator.

What draws me specifically to Crypto.com is the combination of scale and frontier scope. Serving 80M+ users on spot and perpetuals simultaneously is a different product problem than building a niche trading tool: every prioritisation call has global distribution consequences, and the compliance constraints are real across multiple jurisdictions. I have shipped in that kind of regulated, multi-region environment, at R&S across a multinational FCAS programme, at the Federal Employment Agency at national scale, and I find those constraints sharpening rather than limiting.

I would welcome the chance to talk through the trading roadmap and where the role sits in Crypto.com's priorities for the year ahead.

Best regards, *Philipp Hilbert*
