

Philipp Hilbert. *Security product veteran who ships AI-native platforms.*

Positioning, thirteen years owning regulated B2B products, from quantum-secure encryption to defence AI, meet a company building autonomous, intelligent security for an always-shifting threat surface.

spiderSilk's premise, that security must be continuous, intelligent, and autonomous, is one I find technically credible and strategically important. Organisations that depend on point-in-time snapshots of their attack surface are always one deployment behind the threat. A platform that closes that gap autonomously is not a nice-to-have; it is the direction the whole category is moving. That makes the product problem at spiderSilk genuinely interesting to me.

My background directly relevant to this role spans two threads. The first is security infrastructure: as co-founder and product owner at Qcrypt AG I designed and shipped a quantum-secure encryption product, hardware plus software, that enterprise buyers could install in under two minutes rather than the days competitors required. I held the deputy IT security officer role at Bundesagentur für Arbeit, where I owned identity management and data governance for national-scale government systems. I know what it means to build products where a missed security decision has real downstream consequences.

The second thread is AI-native platform ownership. At Rohde & Schwarz I managed the internal AI and data platform for the FCAS European defence programme: I introduced GitOps delivery with ArgoCD that cut rollout time from days to 30 minutes, and I redirected the product away from a well-designed UI nobody used toward a developer-code-first approach that people actually adopted. Building AI products means being willing to let instrumentation override aesthetic preference, which is a discipline I have practiced under real programme pressure.

Translating complexity into something a cross-functional team can execute is where I add the most consistent value. At CLINET Platforms I implemented the CompuGroup Medical hospital interface myself and cut digital anamnesis time from 30 minutes to 5. At EMIL Group I restructured an 18-person delivery organisation losing its senior engineers into three focused teams: attrition dropped to a single departure and we shipped the Claims Center from concept to production. At Scheidt & Bachmann I ran product ownership inside a full SAFe setup with agile release trains across a matrix organisation. The patterns are different but the underlying capability, understanding the system well enough to make the right cuts, transfers directly to owning a security product roadmap under competitive pressure.

spiderSilk sits at the intersection of threat intelligence, engineering, and go-to-market, and the job description is honest that this is a complex stakeholder environment. I have operated in exactly that configuration, defence, government, healthcare, insurance, and the consistent output has been teams that are clearer, faster, and less dependent on heroics. I would welcome the conversation.

Best regards, *Philipp Hilbert*
