Dear Wire IT team,

I am writing to apply for the Data & AI Product Owner position. Wire IT's positioning, senior-led consulting that stays deliberately agile and people-centred, matches the way I prefer to work: close to the team, outcome-focused, and transparent with stakeholders about what the backlog can and cannot promise.

My most directly relevant experience is the internal AI and data platform I owned at Rohde & Schwarz for the FCAS European programme. I managed a cross-functional team of 15+ engineers and data scientists through Scrum in Jira and Confluence, drove GitOps delivery with ArgoCD that cut rollout time from days to 30 minutes, and redirected the product strategy mid-cycle after workflow instrumentation showed that a UI-led approach was recording zero real usage. The result was a 200% increase in pipeline runs. That project required exactly the skills your posting highlights: translating business needs into product priorities, refining tickets and writing user stories with clear acceptance criteria, coordinating dependencies across multinational teams, and maintaining sprint discipline across time zones.

At the Bundesagentur für Arbeit I owned a national labour-market analytics platform. I introduced Dagster and dbt for ETL orchestration, cutting quarterly data-update effort by roughly 75%, and carried a full UI relaunch and a bare-metal-to-containers migration through the same period. This is the data and analytics literacy your posting asks for, applied to a platform used by policymakers and researchers rather than internal engineers, which sharpened my ability to write requirements that bridge technical feasibility and business value.

My B2B SaaS and Insurance background comes from EMIL Group, where I shipped the Claims Center from concept to production and cut time-to-market for a new insurance product from months to under a week. I restructured an 18-person delivery organisation into three lean teams with dedicated leads, reducing attrition from near-total exodus to a single departure. Stakeholder management under pressure, not just in calm water, is where that experience was built.

On the AI side, I prototype and iterate daily with Claude Code, GitHub Copilot, Cursor, and Lovable, and I have designed agentic workflows in n8n. I am honest that my data platform experience runs on Dagster, dbt, and PostgreSQL rather than Microsoft Fabric specifically, but the orchestration, modelling, and change-management patterns are the same, and I am ready to close that gap fast.

Wire IT's ambition to grow while keeping its agile, people-centred culture intact is the kind of challenge that suits a product owner who has done that restructuring work from the inside. I would be glad to bring that to your clients.

Best regards, *Philipp Hilbert*
