

Philipp Hilbert. *AI Product Manager, construction intelligence.*

Positioning, Ten years building AI-native and B2B SaaS products; now targeting the agentic layer where construction data becomes decisions.

Dear SuperHive and AI71 team,

I am applying for the Product Manager role on SuperHive's product squad. My background is ten years of product ownership across regulated industries, defence AI, public-sector analytics, insurance, payments, healthcare, with the last two years focused explicitly on AI-native products, agentic workflows, and LLM evaluation. SuperHive operates at the intersection of those things, applied to the world's largest industry, and that combination is where I want to spend the next chapter.

The posting describes a PM who prototypes with frontier models before handing work to engineering, designs and reads evals, and drives the graduation decision when a client-specific feature is ready to become a platform capability. That is precisely how I work. At Rohde & Schwarz I owned the internal AI and data platform for the FCAS European defence programme, a cross-functional team of fifteen engineers and data scientists, a GitOps delivery model, and the discipline to instrument competing workflows before committing to a direction. The result was a 200% increase in pipeline runs by redirecting strategy away from a polished UI that recorded exactly zero clicks. The lesson transfers directly to construction-intelligence agents: the workflow that feels right in a demo and the workflow users actually run are often different things, and the only way to find out is to measure both.

At EMIL Group I rebuilt a fragile eighteen-person delivery organisation into three focused teams with their own leads, stopped the senior-engineer exodus, and shipped the Claims Center from concept to production with no prior template. At CLINET Platforms I cut an undeliverable roadmap to its highest-value ten percent, and user acceptance rose more than fivefold. On construct8, my own construction staffing marketplace, built as sole founder, I ran the full product lifecycle for a two-sided B2B platform in the exact domain SuperHive serves: firms, workers, complex trust dynamics, and agents across the funnel so one operator could run the day-to-day. That project gave me direct exposure to the hiring and scheduling workflows, the document friction, and the communication patterns of construction firms, context I would bring into a SuperHive squad from day one.

The detail in the posting that speaks most directly to how I work is the note that Claude Code is part of how the team runs day to day, and that the PM pod is expected to work alongside agents as a normal part of the job. I build that way already: I use Claude Code, GitHub Copilot, Cursor, Lovable, and n8n for agentic orchestration in my own prototyping and spec work. I am not learning to use these tools for this role; I am already using them to do the same kind of scoping, validation, and evaluation work the posting describes.

I am an EU citizen, fluent in English and German, and actively targeting the UAE, I am prepared to relocate to Abu Dhabi for an on-site or hybrid setup. I would welcome the chance to speak with the team about where the squad's current roadmap sits and what the next quarter's biggest open questions are.

Best regards, *Philipp Hilbert*
