Dear Revolut hiring team,

Revolut's crypto product sits at an unusually interesting intersection: regulated financial infrastructure, real-time execution systems, and a consumer product used by tens of millions of people. That combination is what drew me to this role. I have spent ten years as a product owner and product manager in regulated fintech and enterprise software, and I have spent the last eight years as a serious participant in crypto markets, not as a casual user, but as someone who studies execution quality, market microstructure, and the infrastructure layer that makes digital asset markets function at scale.

My fintech roots are practical. I founded Kvitt Payment Solutions, a mobile P2P group payments product that was acquired by Sparkasse and integrated into the girocard ecosystem. That experience taught me what it means to build within a regulated payment network: the compliance constraints, the integration surface with banking infrastructure, and the gap between what users want and what a regulated environment permits. Later, at Bundesagentur für Arbeit, I acted as Deputy IT Security Officer while simultaneously owning the national labour-market analytics platform, managing ETL migrations, containerisation, and test automation on a live government system. Regulated, high-stakes, no margin for downtime, that is the environment I am comfortable in.

On the crypto side, I actively trade and manage positions across centralized and decentralized venues: Hyperliquid for perpetual futures, Jupiter and 1inch for DEX aggregation, Across Protocol for cross-chain bridging. I work with liquidation heatmaps and market data from Coinglass and Hyblock Capital, and I have built my own backtesting engine and agentic decision framework for evaluating execution quality. I understand the mechanics of order routing, price impact, slippage, and the custody and liquidity infrastructure that sits behind a product like Revolut's crypto offering. This is not background reading, it is how I spend my evenings and weekends.

The role calls for experience delivering high-performance systems in regulated environments and driving integration with third-party infrastructure such as liquidity venues and custodians. At Rohde & Schwarz, I managed a cross-functional team of fifteen engineers and data scientists delivering the internal AI and data platform for the FCAS European defence programme, using GitOps with ArgoCD to cut deployment time from days to thirty minutes. At CLINET Platforms, I integrated a CGM hospital information system interface that reduced a clinical workflow from thirty minutes to five. These are the kinds of integration and delivery problems I have solved repeatedly, and the crypto infrastructure domain applies the same rigour at higher velocity.

I would welcome the opportunity to discuss how my background fits the specific challenges on your crypto roadmap.

Best regards, *Philipp Hilbert*
