

Philipp Hilbert. *Institutional-grade product thinking for tokenized real-world assets.*

Positioning, ten years building regulated, cross-functional software products — now applying that depth to the infrastructure layer that makes RWAs usable at scale.

Plume is building something I have been watching closely: a protocol layer that makes tokenized real-world assets accessible without hiding the regulatory complexity under a thin veneer. The Nest vault ecosystem, the compliance/KYC infrastructure, and the partner integration surface are product areas where the hard work is not the smart contract — it is the cross-functional coordination between legal, engineering, custodians, and issuers. That is a problem I have spent a decade learning to solve.

At Rohde & Schwarz, I was the PM for a central AI data management platform inside the European defence programme FCAS — a project where multinational legal frameworks, data provenance requirements, and strict auditability constraints were first-class product requirements, not afterthoughts. I introduced GitOps-based rollout pipelines, reduced deployment times from several days to under forty minutes, and delivered features end-to-end including user stories, acceptance criteria, implementation, testing, and rollout. I mention this not because defence and DeFi are equivalent, but because working inside a hard regulatory envelope while maintaining engineering velocity is a specific operational skill — and Plume's job description is asking for exactly that.

At Emil Group, I joined an InsurTech SaaS platform that was losing client trust and developer retention simultaneously. I split a bloated seventeen-person team into functional Scrum units, reintroduced velocity tracking and structured refinement, and delivered a Claims Center module from concept to production. The domain — primary insurers, reinsurers, MGAs, underwriters — is as paper-heavy and compliance-constrained as securities issuance. The PM job in that environment is to hold the legal and engineering conversations in the same room and translate between them without losing either side. That is the same skill the Plume role names when it says "partner with Legal/Compliance early and often."

My Web3 context is genuine rather than credential-polished. Eight years of hands-on experience across DEXes, AMMs, perpetual markets, bridges, and on-chain custody has given

me a specific kind of user research that is hard to fake: I know where real users get stuck, where trust breaks, and which product decisions create invisible risks that surface only under stress. I actively trade across Hyperliquid, Bitget, Jupiter, and 1inch, analyze execution quality with Coinglass and Hyblock Capital, and have built my own backtesting infrastructure for crypto strategies. That background means I can walk into a conversation about oracle dependency, liquidity risk in vault design, or cross-chain bridge assumptions and engage substantively rather than nod along.

I am based in Berlin, work remote, and am available within four weeks of an offer. I would welcome a conversation about which product area – asset onboarding, the Nest ecosystem, compliance infrastructure, or partner integrations – is the most constrained right now, and where a PM who can run tight cross-functional loops would move the needle fastest.

Best regards, *Philipp Hilbert*
