Dear ArcSite team,

The challenge you are hiring for is one I find genuinely interesting: becoming the domain authority for a specific customer vertical, then translating that authority into a product roadmap that field-facing teams can actually use. That sequence—deep discovery first, strategy second, execution third—is how I have approached product work across nearly ten years, and it is the reason I am applying.

My most directly relevant parallel is the mobile healthcare app I delivered at CLINET Platforms. Hospital workflows have the same structural qualities as construction field workflows: highly domain-specific, resistant to abstraction, driven by practitioners who will abandon a tool the moment it adds steps rather than removing them, and complicated by external system dependencies the PM cannot control. On that project I built stakeholder trust by mapping the actual clinical workflow before writing a single requirement, and by being transparent with hospital IT teams about the constraints imposed by legacy APIs and external databases. The result was a shipped product, on deadline, that covered digital anamnesis, document storage, meal and therapy plans, and a CGM interface into the hospital information system.

At Emil Group I inherited a 17-person team in a prototype-stage InsurTech environment where client trust had eroded and sprint discipline had collapsed. I re-established structured refinement, split the team into effective Scrum units, reintroduced velocity tracking, and ran weekly product workshops with clients to make the roadmap legible again. Senior developer attrition dropped to a single departure. The experience reinforced something I have seen repeatedly: customers and engineers both perform better when the PM runs tight discovery and communicates decisions with explicit rationale rather than presenting conclusions as given.

On the technical side, I have shipped across analytics platforms, AI data management systems, mobile apps, and B2B SaaS configurators. I am comfortable working in the data layer—I introduced Dagster for automated ETL pipelines at the Federal Employment Agency and spent

a year at Rohde & Schwarz owning a multimodal data transformation platform for the FCAS defence programme. That technical grounding means I can engage meaningfully with Engineering on feasibility constraints rather than treating them as a black box, which shortens the distance between discovery and delivery.

I do not have professional experience in construction or pre-construction workflows, and I want to name that directly rather than paper over it. What I bring instead is a track record of becoming the domain expert in unfamiliar verticals quickly—through structured interviews, workflow mapping, and close partnership with Sales and Customer Success—and of converting that understanding into product decisions that hold up under technical and business scrutiny. The ArcSite customer base sounds like exactly the kind of expert practitioner audience I work best with: opinionated, time-pressured, and with very clear signals about what is and is not working.

Best regards, *Philipp Hilbert*
