Dear Riverty Hiring Team,

I am applying for the Product Manager Integration role because the challenge you describe is one I have spent the better part of a decade getting good at: taking complex, operationally messy processes that are currently handled inconsistently across teams and turning them into scalable, standardised systems with genuine product ownership behind them.

My most directly comparable experience is at Emil Group, where I joined a B2B InsurTech platform that had slipped into prototype-stage chaos – inconsistent delivery, eroding client trust, and a team structure that had grown too large to function as a coherent unit. I restructured the team into focused Scrum units, reintroduced velocity tracking and ownership, and re-established the rhythm of reliable weekly delivery. Regaining client trust was not a communication exercise; it came from actually shipping predictable, working software. That is the same discipline Riverty's integration challenge requires: making onboarding reliable enough that clients and internal stakeholders can plan around it.

At Rohde & Schwarz I owned a data management platform under a European defence programme with multinational stakeholders and strict auditability requirements. The work required translating domain-specific requirements – from data scientists, ML engineers, security officers, and programme management – into production-ready features with clear acceptance criteria, testable outputs, and documented provenance. The closest parallel to your standardisation challenge was designing transformation pipelines and data tagging schemes that could be applied consistently across heterogeneous data sources rather than customised ad hoc every time. That is the same structural instinct your role is asking for in client integration: reusable, configurable, verifiable.

At the Federal Employment Agency I served as Deputy IT Security Officer while simultaneously owning the analytics platform product roadmap – an unusual combination that sharpened my sense of how governance and product velocity interact. Regulatory and compliance constraints are not obstacles to good product design; they are constraints that, modelled correctly, produce

more durable standards. I expect Riverty's regulated fintech context to surface the same dynamic, and I am comfortable operating in it.

I am a native German speaker with business-level English and more than ten years of experience working in cross-functional, international settings. I have found that the quality of written standards and documentation matters at least as much as the quality of the initial product decision – both because standards only work if people understand them, and because client-facing integration work surfaces ambiguities quickly and without mercy.

I would be glad to discuss how my background maps to your specific integration architecture and roadmap challenges.

Best regards, *Philipp Hilbert*
