Dear Hiring Team at Boerse Stuttgart Digital,

I am applying for the Senior Product Manager role on the BISON app. BISON is one of the few crypto platforms in Europe that has earned genuine retail trust by staying regulated and transparent, and that is a product foundation worth building on seriously. I have spent eight years as an active crypto user – trading spot and perpetuals on centralised and decentralised venues, managing cross-chain positions, studying market microstructure – and the last ten years delivering software products in regulated, complex environments. This role is a direct intersection of those two tracks.

My most recent role was at Rohde & Schwarz on the FCAS programme, where I owned a cross-functional team delivering an AI data management platform under European defence governance constraints. The regulatory and audit requirements there were strict, the stakeholder landscape was multinational and demanding, and the delivery cadence was unforgiving. I drove end-to-end feature delivery autonomously – from user story through implementation support to GitOps rollout – and cut deployment times from several days to under forty minutes by introducing ArgoCD-based pipelines. The ability to hold both the strategic frame and the technical detail simultaneously is something I built there under real pressure.

Before that, at Emil Group, I inherited a seventeen-person Scrum team that had lost delivery rhythm and client trust. I restructured it into smaller, focused units, reintroduced velocity tracking and structured refinement, and used weekly product workshops to rebuild the client relationship. Within one quarter, the team was shipping predictably again. That experience taught me that cross-functional leadership is not about authority – it is about creating the conditions where engineers, designers, and stakeholders can move without waiting for permission. The BISON posting names exactly that as a core expectation.

My crypto knowledge is not background reading. I actively trade perpetual futures on Hyperliquid, aggregate DEX routing via Jupiter and 1inch, manage cross-chain positions through Across Protocol, and spend significant time with liquidation analytics platforms like Coinglass and Hyblock. I have built a personal backtesting engine to systematise strategy research, and I have developed detailed frameworks for algorithmic execution and risk management. When a user of BISON asks why their limit order did not fill, or why a withdrawal is delayed, or how leverage works – I understand the full stack behind that question, and I can translate it into product decisions that reduce friction without compromising the regulatory guardrails that make BISON trustworthy.

I speak German natively and English at C2 level, and I am comfortable presenting complex topics to both technical teams and executive stakeholders. I would welcome a conversation about how my background maps to what the BISON team is building next.

Best regards, *Philipp Hilbert*
