

Philipp Hilbert. *Platform PM who ships AI-native products end-to-end.*

Positioning, hands-on platform PM with a decade of B2B SaaS delivery, AI product execution, and the technical depth to move from discovery to prototype to production without a handoff.

Dear WTS Advisory team,

Platform products inside professional service firms are harder to build than they look. The value of the domain knowledge is real, but it is locked inside individual practitioners, not yet in software. The job is to extract it, make it configurable, and turn it into something clients and internal teams actually adopt. That is the problem I find most interesting, and it is exactly what the WTS Platform role describes.

My relevant recent experience is at Rohde & Schwarz, where I owned the product roadmap for a central AI and data management platform inside the European defence programme FCAS. The platform had to serve data scientists, domain experts, and auditors at the same time, with strict requirements on data provenance, audit trails, and explainability. I ran discovery with each stakeholder group separately, built rapid prototypes to test assumptions, and then drove features end-to-end from user story through acceptance testing to GitOps rollout. I reduced deployment times from several days to under forty minutes. The dynamic at WTS – service lines as both internal user and subject-matter expert, with enterprise clients as the end beneficiary – maps closely to what I navigated there.

At the Federal Employment Agency I owned an analytics platform serving regional policymakers and labour market researchers. I introduced Dagster-based ETL pipelines, designed interactive dashboards, and served concurrently as Deputy IT Security Officer. The work required translating between economists who thought in indicators and engineers who thought in tables – the same translation layer a tax platform PM must maintain between Steuerexperten and engineering. At Emil Group, where I rebuilt a bloated InsurTech platform team and delivered a Claims Center module from concept to production, I learned what structural sprint discipline and clear ownership models mean for a B2B SaaS product under delivery pressure.

On the AI side, I work daily with Claude Code, GPT, Lovable, Framer, GitHub Copilot, and n8n. I have designed multi-agent orchestration workflows and built autonomous feature delivery pipelines. I know how to scope an AI use case, instrument it for quality measurement, and communicate the result in business terms to leadership – which is precisely what the posting asks for when it says "du machst Qualität und Mehrwert messbar."

I do not have a tax background, and I am not pretending otherwise. What I bring is a decade of structured product discovery in regulated, expert-heavy domains, and the technical depth to go from whiteboard to prototype to shipped feature without losing either the practitioner's intent or the engineering team's confidence. I would be glad to walk through a specific example in a first conversation.

Best regards, *Philipp Hilbert*
