Dear SIXT Hiring Team,

I am applying for the Technical Product Owner role on SIXT's internal pricing tools. The job description is unusually direct about what the role actually requires: understand the existing system deeply, talk to users, build a working prototype, validate it, and hand it over to engineering. That is a sequence I have run in full at multiple companies, and it is the kind of work I find most valuable to do.

At Rohde & Schwarz, I owned a central AI and data management platform inside a defence programme with multinational stakeholders. Requirements were incomplete, the infrastructure was opaque, and engineers were blocked on features that had been outstanding for over a year. I unblocked infrastructure-level issues in OpenShift independently and delivered a complete feature in one week that the project lead had been requesting from engineers for months. What made that possible was not heroics – it was the habit of reading systems directly rather than waiting for documentation.

At the Federal Employment Agency, I advanced a public analytics platform for regional labour market data. I introduced automated ETL pipelines with Dagster, migrated legacy systems to Kubernetes, and served as Deputy IT Security Officer. The work required translating between data scientists, backend engineers, policy stakeholders, and compliance – the same cross-functional alignment that pricing tools at SIXT's scale demand daily.

At Emil Group, I joined a B2B InsurTech SaaS platform where delivery had broken down. I re-established sprint discipline, split a bloated 17-person team into effective Scrum units, and regained client trust through structured weekly workshops. The Claims Center module I designed went from concept to production on schedule. Internal tooling for regulated, high-stakes business processes is where I am most comfortable – and pricing tools at a global mobility operator are exactly that.

I use Claude Code, Lovable, Cursor, and GitHub Copilot in daily product work. The prototyping requirement in this role is not a stretch – it is how I already validate ideas before they reach engineering. I am also open to relocating to Munich, which I understand is where this team is based.

Best regards, *Philipp Hilbert*
