

Philipp Hilbert. *Product Manager for AI-driven property operations.*

Positioning, ten years translating complex operational workflows into scalable SaaS – now applying that to property management at the intersection of AI agents and real-estate process automation.

Dear Lukas,

Property management is one of the few domains where the operational complexity is genuinely as hard as it looks from the outside. Tripartite relationships between owners, tenants, and service providers, maintenance chains with external dependencies, and compliance obligations that resist simplification – these are not problems that a generic SaaS workflow engine solves. When I read the Alina job description and saw AI agents and workflow automation named explicitly, alongside direct collaboration with the founder, I recognised a product problem that matches the kind of work I find most energising: taking a messy operational reality and building a system around it that actually holds.

My background is almost entirely in exactly this class of problem. At Rohde and Schwarz I owned a central AI data management platform for a European defence programme, translating requirements from multinational stakeholders into dev-ready specifications, then delivering feature sets end-to-end from user story through GitOps rollout. At the Federal Employment Agency I owned the Arbeitsmarktmonitor analytics platform, introducing automated ETL pipelines with Dagster, migrating legacy systems to Kubernetes, and serving concurrently as deputy IT security officer. At Emil Group I walked into a prototype-stage InsurTech product where client trust had eroded, split a bloated seventeen-person team into effective Scrum units, reintroduced velocity tracking, and ran weekly product workshops until delivery was stable again. Each of these was a different industry, but the mechanic was the same: map the real workflow, write the right requirements, hold the team to the right discipline, and ship.

The AI agent and workflow automation angle in the Alina posting is not incidental to me – it is the direction I have been building toward. I work daily with n8n for agentic workflow design, with Claude Code and Cursor for LLM-assisted specification and implementation, and with Lovable and Framer for rapid prototyping. I am not describing tools I have read about; I use them to compress discovery-to-prototype time on real problems. For a SaaS product that is

betting on AI agents to improve maintenance coordination between owners, tenants, and service providers, having a PM who can evaluate agent design decisions and write technically credible specifications is a meaningful advantage.

On the domain side: I do not have prior real-estate product experience, and I prefer to name that directly rather than paper over it. What I do have is a consistent track record of ramping quickly in new verticals – defence data platforms, public labour-market analytics, health insurance, healthcare apps – and a strong instinct for where the real workflow pain lives versus where it is assumed to live. Property management is a domain I can learn fast, particularly with direct founder access and short decision cycles.

The profile of this role – investor-independent startup, high ownership, direct founder collaboration, international development team, AI product at the centre – is the kind of environment where I do my best work. I would be glad to speak with you about the specifics.

Best regards, *Philipp Hilbert*
