Dear Hiring Team at Riverty,

I am applying for the Product Manager Integration role because the core problem – turning a fragmented, high-variance client onboarding process into a scalable, standardised platform capability – is the kind of systems-and-delivery challenge I have spent the better part of a decade working on.

At Rohde & Schwarz I owned a data management platform for the FCAS defence programme, where the constraint was exactly the one you describe: a diverse set of internal stakeholders with different data requirements, and a platform that had to absorb them without becoming a bespoke integration for each one. I designed reproducible data transformation pipelines, introduced audit trails and provenance, and delivered autonomous feature sets end-to-end – user stories through GitOps rollout – in an environment where requirements were never fully stable. The same pattern applies directly to Riverty's integration and onboarding surface.

At the Federal Employment Agency I served as product manager for the Arbeitsmarktmonitor analytics platform and simultaneously as deputy IT security officer. That combination – technical accountability alongside stakeholder-facing product work – trained the habit of translating between what a non-technical stakeholder needs and what an engineering team can sustainably build. I introduced Dagster for automated ETL, standardised CI/CD, and managed Kubernetes migrations: the kind of infrastructure-adjacent product ownership that Riverty's integration platform work demands.

Earlier, at Emil Group, I inherited a B2B InsurTech platform in poor health: a 17-person team with no sprint discipline, near-total senior developer attrition risk, and a client base that had lost confidence in delivery. I split the team, reintroduced velocity tracking and structured refinement, and rebuilt client trust through weekly product workshops. That experience confirmed something I have relied on since: shared ownership is not a soft concept – it is an

engineering artefact. You build it through consistent processes, clear interfaces between teams, and visible accountability for decisions.

The Riverty role asks for someone who can own vision and roadmap while also getting into the weeds on data models, interface standards, and configuration templates. That combination is where I work most naturally. I hold technical context seriously enough to contribute meaningfully in engineering discussions, and I have enough product strategy experience to make sure that standardisation efforts are tied to measurable business outcomes rather than architectural tidiness.

I would welcome the opportunity to speak in more detail. My notice period is four weeks, and I am available across Berlin, Verl, and Baden-Baden on the hybrid model described.

Best regards, *Philipp Hilbert*
