Dear Riverty team,

Payment products sit at the intersection of operational complexity and consumer trust – and getting that intersection right is the work I find most interesting. Riverty's Installments & Payments role is asking for exactly the kind of product ownership I have been doing across regulated environments for nearly a decade: translating layered business rules and regulatory requirements into self-service flows that actually work for the people on the other end of them.

My most directly relevant precedent is Kvitt Payment Solutions, which I co-founded and built from zero: a group-based P2P payment product covering settlement logic, PSP integration, edge-case handling, and a full mobile prototype. I owned everything from the initial UX design to the technical integration to the eventual handover when Sparkasse acquired and operated the product. That experience gave me a concrete, long-cycle view of what breaks in payment flows under real conditions – partial payments, disputed splits, failed retries, user abandonment at confirmation screens – the same failure modes that a collection-context payment product needs to handle gracefully.

More recently at Rohde & Schwarz, I delivered an automated data transformation and audit platform inside the FCAS programme – a government contract with multinational stakeholders, strict data lineage requirements, and no tolerance for opaque decisions. I reduced deployment times from multiple days to under 40 minutes through GitOps, unblocked infrastructure issues the senior engineering team had queued for over a year, and delivered autonomous feature sets end-to-end from user story to production rollout. The discipline required there – treating auditability and reproducibility as product requirements, not afterthoughts – transfers directly to regulated payment and collection products where every decision about a consumer's repayment terms needs to be traceable.

At Emil Group's InsurTech platform I re-established delivery stability in a prototype-stage environment that had lost client trust. I restructured a 17-person team into smaller scrum units,

reintroduced velocity tracking and structured refinement, and ran weekly product workshops to rebuild transparency with clients. That experience is relevant to Riverty's stated goal of enabling teams to configure and apply payment logic independently – the harder problem is not designing the logic, it is building the documentation, training, and review structures that make it usable without the product manager in the room.

I work natively with AI tools in my product process – Claude and GPT for requirements and edge-case synthesis, n8n for workflow automation prototyping, Lovable for rapid front-end concept validation – and I bring five years of practical Python experience that lets me read and challenge data and automation proposals rather than depend on engineers to interpret them. I am based in Berlin, authorised to work in Germany without restriction, and available on four weeks' notice.

I would welcome the chance to talk through what the Installments & Payments roadmap looks like today and where you see the biggest leverage points over the next 12 months.

Best regards, *Philipp Hilbert*
