Dear Aquanow Hiring Team,

I am applying for the Product Owner, Stablecoin Payments role in Dubai. My interest in this position is not incidental: I have spent the better part of a decade studying and participating in the infrastructure layer that makes digital asset markets function, stablecoins, custody, settlement rails, DEX routing, cross-chain bridging, and I have reached a point where I want to direct that knowledge into building products at an institutional scale, rather than continuing to study it from the outside.

On the product ownership side, the work I am proudest of has shared a common shape with what you describe: technically complex, early-stage, and owned deeply rather than managed at arm's length. At EMIL Group I took the Claims Center from concept to production with no precedent, restructuring an 18-person delivery organisation into three lean teams in the process, and cutting time-to-market for a new insurance product from months to under a week. At Rohde & Schwarz I pushed my way into the customer workshops, instrumented two competing workflows, and redirected a product away from the beautiful UI that recorded zero clicks and toward the developer-code-first design people actually used. At CLINET Platforms I implemented a hospital information system interface myself, cutting a clinical workflow from thirty minutes to five. In each case the value came from staying close enough to the engineering reality to make the right call quickly, not from managing upwards.

The specific content of the Aquanow role maps well to what I already know. I am comfortable reading and contributing to REST API specifications, authentication patterns, request and response structures, error handling, webhooks, because I have worked in environments where the product owner who cannot engage at that level becomes a bottleneck rather than an accelerant. I understand stablecoin payment mechanics and the operational nuances of crypto settlement from years of active use across centralised and decentralised venues, and from building my own backtesting and execution infrastructure. I am aware of the regulatory landscape, AML/KYC, Travel Rule, MSB licensing, because I owned compliance alignment at Kvitt Payment Solutions when it was acquired into the girocard ecosystem, and because I held Deputy IT Security Officer responsibility at the Federal Employment Agency.

I am also genuinely available for the Dubai role. I am willing to relocate to the UAE and work hybrid from your office there; this is an active preference rather than a reluctant concession. The time-zone overlap with your Canadian engineering teams you mention is a normal part of how I expect to work, not a hardship.

I would welcome the opportunity to go deeper on any of the above in a conversation.

Best regards, *Philipp Hilbert*
