

Philipp Hilbert. *Full-stack product ownership across regulated, high-growth platforms.*

Positioning, Ten years building technical products end-to-end, from payment rails to defence AI, for teams that need one person who can hold a roadmap and a technical conversation simultaneously.

Revolut is asking for someone who can own a technical product roadmap, hold substantive engineering conversations, and navigate compliance and security stakeholders without losing momentum. That is the exact combination I have built over ten years, not as a sequence of roles but as a simultaneous discipline.

At Rohde & Schwarz I owned a module of the central AI backbone for a European defence programme. The constraints there, complete data provenance, audit-grade lineage, safety-critical reproducibility, are materially harder than most fintech compliance requirements, and I drove that product from discovery to production. Deployment times dropped from several days to under forty minutes after I resolved an infrastructure blocker that had sat open for over a year. At Bundesagentur für Arbeit I held the deputy IT security officer designation while delivering a warehouse-grade ETL platform used by national policy researchers, running through recurring external audits. I understand what Financial Crime, Legal and Security counterparts actually need from a Product Owner: precision in requirements, traceability in delivery, and a partner who does not treat compliance as an afterthought.

The payments domain is foundational to my background. Kvitt Payment Solutions, which I co-founded, was a mobile payments platform built from scratch with full PSP integration, settlement flows and onboarding UX, acquired and operated by Sparkasse. Qcrypt AG, my second venture, shipped quantum-secure encryption under a strict sub-two-minute enterprise installation constraint. Both taught me that payment and security products have no tolerance for discovery shortcuts: edge cases that look theoretical in a workshop become incident tickets in production. That lesson shaped how I approach every new product surface since.

Revolut's requirement for direct people management across engineering, operations and design is notable because most product roles at this level keep the PM at arm's length from the team. At EMIL I inherited a 17-person delivery organisation that had lost momentum and was

haemorrhaging its senior engineers. I restructured it into teams that could own something end to end, restored client trust and stopped an almost complete leadership exodus at a single departure. That experience made clear that team structure is a product decision with as much downstream impact as any roadmap choice.

I work AI-native and have for some time, not as a productivity footnote but as a structural change in how I approach delivery economics. With a multi-agent framework I built and operate myself, I cover requirements, interface design, automated testing and infrastructure at a pace that has meaningfully compressed the distance between discovery and shipped product. I bring that same approach to any team I join, which accelerates the pace at which we learn whether a bet was right or wrong.

I would welcome the opportunity to discuss where your current platform challenges sit and what a first quarter might concretely look like.

Best regards, *Philipp Hilbert*
