Dear Revolut Product Team,

I am applying for the Product Owner (UX) role because the combination of consumer-facing mobile product ownership, cross-functional collaboration, and data-informed prioritisation described in the posting matches how I have been working for the past decade, not as an aspiration but as a documented delivery pattern.

My most directly relevant background is the Kvitt Payment Solutions chapter: I co-founded a mobile payments platform from zero, owned the PSP integration, settlement flows, user onboarding, and the full payment UX, and took the product through to acquisition and operation by Sparkasse. That experience taught me that consumer financial products fail not because the feature is missing but because the edge cases in the payment flow, the error states, the failed authorisation screens, are treated as engineering detail rather than product responsibility. I treat them as product responsibility. More recently at Scheidt and Bachmann I owned point-of-sale and payment systems for petrol station retail, working across a complex SAFe organisation that required PI planning, release train coordination, and cross-team dependency management at scale, which maps directly to Revolut's coordination demands across Design, Engineering, and Data.

At EMIL Group I was handed a 17-person delivery organisation that had stalled and was haemorrhaging its senior engineers. I restructured it into teams that could own something end to end, restored velocity, and rebuilt client trust through a claims module I took from zero to production by running discovery directly with pilot customers' claim specialists. No specification existed. That required exactly the entrepreneurial drive and tolerance for ambiguity the posting names as essential. The metric I installed, churn per claim process step, became the team's primary prioritisation input and replaced opinion-based backlog discussions.

Revolut's consumer UX ambition is visible in every product surface it ships: the card spend notifications, the savings vaults, the crypto interface, the travel insurance flow. What I would bring to that is a working discipline of not shipping until the customer journey has been stress-tested against the failure modes a user actually encounters, combined with the analytical infrastructure to know within days of launch whether the bet paid off. I have been doing crypto as a practitioner for eight years, including hands-on use of perpetual futures, DEX aggregators, cross-chain bridging, and market microstructure analytics, which gives me a user's fluency in the product areas where Revolut is growing fastest.

I would welcome the chance to talk through how my background maps to the specific feature area this team is hiring for.

Best regards, *Philipp Hilbert*
