

Philipp Hilbert. *Operational clarity at global scale.*

Positioning, Staff PM with 10+ years shipping complex B2B platforms who turns messy operational landscapes into automated, measurable systems, exactly what Deel IT needs next.

Dear Deel IT team,

I am applying for the Staff PM, Deel IT role because the problem description is one I can read in systems terms immediately: a platform that handles real scale, a layer of manual workflows sitting on top of it that should not exist, and a supplier network that is incentive-aligned but structurally underserved. Those three things together are not a gap, they are a compounding drag on unit economics that only gets more expensive as the operation grows. The role asks for someone who can diagnose that drag, rank the interventions, and drive them to production without being handed a map. That is work I have done repeatedly, in different domains, and I want to do it here.

At Rohde & Schwarz I inherited an AI and data platform that was technically sound but operationally brittle, deployment cycles measured in days, manual steps baked into every release, and a multinational engineering team that had been blocked by an infrastructure problem for over a year. I diagnosed the constraint, restructured the pipeline, and brought deployment time from several days to twenty to forty minutes. The lever was not more engineering effort; it was identifying the one blocker that cascaded into everything else and removing it first. The process of getting there, pulling data from multiple sources, forming a clear hypothesis, and defending a prioritisation call against experienced architects, is the same process the Deel IT role is asking for, applied to a logistics and supplier context rather than a defence data pipeline.

At EMIL Group I took on a 17-person delivery organisation that had stalled and was losing its senior engineers. The root cause was not skill; it was that teams were executing tickets without owning outcomes. I restructured the organisation into units that could own a surface end to end, rebuilt the feedback loop between discovery and delivery, and instrumented the claim flow so that churn per process step became the prioritisation signal rather than stakeholder preference. Velocity returned, client trust returned, and an almost complete exodus stopped. The pattern the

Deel IT role describes, ops teams, engineering, suppliers, and finance as four distinct worlds that need translation between them, is a familiar coordination topology, and restructuring the feedback loop between them is where I add the most leverage.

On automation specifically: my approach is AI-native rather than AI-augmented. I run a multi-agent framework for my own product work in which coordinator, implementer, and evaluator agents operate a shared queue under guardrails I designed. I use Claude Code, Cursor, n8n, and Lovable daily, not as productivity tools but as structural components of how I scope, prototype, and validate. When the job description says "AI-native as your default, not a nice-to-have," I read that as a statement about how the team thinks, not a checkbox, and it matches how I already operate.

The scope here, logistics, device lifecycle, IT support, supplier networks, SLAs, and the financial layer underneath all of it, is large, and that is the point. I am drawn to roles where the roadmap has to be earned rather than inherited, and where the cost of a slow decision is visible to the whole company. I would welcome the opportunity to discuss where the highest-leverage intervention sits right now, and what shipping the first automation would prove.

Best regards, *Philipp Hilbert*
