Dear Hiring Team,

I am applying for the Product Manager II, Fraud role at Kraken. My background is in building regulated operational infrastructure, defence AI platforms, national health data systems, payment and forecourt integrations, and I have spent the last several years working on exactly the cross-functional coordination problems this role describes: translating complex technical systems into clear product requirements, aligning engineering with legal and compliance, and managing third-party vendor integrations end to end.

The specific project that draws me to this role is the case management revamp for fraud and ATO. At Rohde & Schwarz I owned a comparable restructuring: a multimodal AI data pipeline that arrived in a fragmented, UI-heavy state and needed to be rebuilt into a developer-friendly, hotfix-capable platform. I drove that from discovery through rollout, reducing deployment time from days to 30 minutes. The operational pattern, mapping the current workflow, finding the friction, slicing a delivery sequence, and keeping Legal and engineering aligned throughout, is the same one I would bring to Kraken's fraud case management.

At EMIL Group I restructured a 17-person monolithic team into three domain-led squads with their own leads because the previous structure was producing output, not outcomes. Cross-functional discipline was the mechanism: clear ownership boundaries, metrics defined before build, and a Claims Center launch that came out of that restructured team as the first proof point. At Bundesdruckerei I owned the RKI's vaccination statistics and viral-mutation tracking systems under the highest identity and privacy constraints, a regulated, multi-stakeholder environment not structurally different from Kraken's jurisdictional compliance requirements.

My crypto engagement goes beyond domain literacy. I actively trade on Hyperliquid, Bitget, Jupiter, and 1inch, I have studied market microstructure, liquidation dynamics, and execution quality across CEX and DEX venues for years, and I have built my own agent framework for research and trading automation. I understand the difference between a legitimate power user and a suspicious one, and why that distinction is the hardest thing to encode in a fraud system that cannot afford false positives.

I would welcome the opportunity to walk through the case management problem in more detail and show how I would approach the first discovery sprint.

Best regards, *Philipp Hilbert*
