

Philipp Hilbert. *AI-native product leader who ships.*

Positioning, 10+ years turning ambiguous enterprise briefs into delivered AI products, with the stakeholder fluency and technical depth UAE clients expect.

To the hiring team,

You are looking for a product manager who can take an enterprise or government client's vague AI ambition and turn it into something delivered. That is not a role for someone who has studied AI product management; it is a role for someone who has done it in high-stakes environments where the cost of getting the scope wrong is measured in months, not sprints. That is the work I have been doing for the past decade.

At Rohde & Schwarz, I owned the product for a defence AI data platform feeding the FCAS programme. The core challenge was identical to what your clients face: multiple engineering teams, a legacy pipeline that nobody trusted, stakeholders at varying levels of technical literacy, and an expectation that AI would somehow make it all better without anyone being able to define better. I resolved that by making discovery continuous, running structured workshops to surface the real constraints, and negotiating outcome-based requirements with the engineering lead rather than handing over a decree. The result: rollout time dropped from days to 30 minutes, the platform became fully hotfix-capable, and the product shifted from UI-heavy to developer-friendly in a way the client had not anticipated but immediately valued.

At construct8, I operate in a zero-to-one context, using LLM agents and messaging APIs (WhatsApp, Telegram) to automate construction-marketplace workflows that previously required manual operations. I prototype disputed flows as clickable products in a day using Lovable and Framer, run the resulting demos with end users, and feed the findings back into the backlog the same week. That cycle, prototype → validate → ship → measure, is what your job description calls an AI-native mindset, and it is now my default working mode.

The UAE market adds one dimension I am actively interested in: government-scale digital transformation with short delivery windows and high executive visibility. My background at Bundesdruckerei (national health data infrastructure, RKI) and Bundesagentur für Arbeit (public analytics platform for a country of 84 million) gave me direct experience navigating public-sector governance and communicating product strategy to audiences who care about outcomes, not architecture. I am ready to bring that experience to the Gulf context and I am willing to relocate to Abu Dhabi.

I recognise that my CV does not show a smart-cities or IoT product title. What I do bring is the underlying mechanics: sensor-to-dashboard data pipelines, enterprise integration across heterogeneous systems, and the stakeholder-management pattern that makes public-sector digital products actually get used rather than merely get launched. I am a fast domain learner and I have the reference points to ramp quickly.

I would welcome a conversation about the specific client contexts and delivery challenges your team is navigating.

Best regards, *Philipp Hilbert*
