

Philipp Hilbert. *Product Owner who closes the loop between strategy and sprint.*

Positioning, ten years of backlog ownership, cross-functional alignment, and regulated-environment delivery, now targeting Abu Dhabi on-site.

Halian's Product Owner posting describes a role I have held, in substance, across ten years and six organisations: owning the backlog, running Agile ceremonies, bridging technical teams and business stakeholders, and driving delivery in regulated, customer-facing environments. That is not a stretch of my experience, it is a precise description of it.

At EMIL Group I inherited a seventeen-person team delivering an InsurTech low-code SaaS platform. Velocity was poor, ownership was diffuse, and the backlog was a wish list. I restructured the team into three focused squads with embedded leads, launched the Claims Center, and shifted prioritisation from stakeholder volume to business-value scoring. The platform lets insurers launch products in days instead of months; that outcome required exactly the backlog discipline and stakeholder negotiation the Halian posting calls out.

At Bundesdruckerei I owned two RKI projects, DIM and DESH, tracking vaccination statistics and viral-mutation data for Germany's national health authority. The environment combined the strictest identity management requirements with genuine urgency; requirements had to be airtight before a line of code was written, and every change had an audit trail. I translated epidemiological workflows into product requirements and held the line on scope under significant institutional pressure. That experience maps directly to the regulated-environment and compliance-management dimension of this role.

At Bundesagentur für Arbeit I ran a full ETL migration and UI relaunch for a public labour-market analytics platform. The work required decomposing legacy data workflows into discrete, deliverable slices, precisely the skill the posting names as breaking down complex business workflows into actionable product requirements. The platform went from inaccessible raw data to searchable, filterable, social-media-ready insights; the migration happened without a single public-facing outage.

I operate AI-first: a disputed flow becomes a clickable prototype in a day using Lovable or Framer, which compresses the discovery-to-decision cycle and keeps engineering time focused on validated work. Jira and Miro are daily tools, not credentials I list for completeness.

Abu Dhabi on-site is a location I am actively pursuing and willing to relocate to immediately. I am available on four weeks' notice.

Best regards, *Philipp Hilbert*
