Dear hiring team at métier - Strategic HR Solutions,

HR software is a domain I have observed closely: the workflows are operationally dense, compliance requirements are non-negotiable, and the gap between what an AI model can do in a demo and what it reliably does in a production system used by HR practitioners under time pressure is often brutally wide. Closing that gap is a product problem, not an engineering problem, and it is exactly the kind of problem I have spent ten years learning to solve.

At Rohde & Schwarz I owned the AI data platform for the FCAS defence programme, where the core challenge was making multimodal AI training data interoperable across incompatible source systems and getting it into a single homogeneous standard the data science team could actually use. I reduced rollout time from days to thirty minutes, made the pipeline fully hotfix-capable, and steered the product from a UI-heavy interface toward a developer-friendly API surface, a trade-off that required sustained negotiation with stakeholders who had invested in the original direction. That is the same trade-off muscle this role asks for: model accuracy versus latency, user experience versus cost, compliance versus feature velocity.

At the Bundesagentur für Arbeit I managed a public analytics platform migration, bare metal to container, ETL relaunch with Dagster and dbt, and a UI relaunch, while keeping a live public service running. Compliance, privacy, and zero-downtime delivery are not abstract concerns for me; they are the constraints I have shipped inside. At EMIL Group I took a seventeen-person team that was moving too slowly and restructured it into three nimble squads with leads, which is how the Claims Center shipped. Structural and operational repair is something I do as a product function, not as a side effect.

On the GenAI side, I work AI-natively every day: Claude Code for in-repo work and requirements, Lovable for rapid prototyping that produces something stakeholders can react to in hours, n8n for agent workflow orchestration, and a personal project building an autonomous agent framework and backtest engine. I understand RAG pipeline architecture, vector database trade-offs, and LLM orchestration at a level that lets me have substantive conversations with engineers about implementation choices rather than simply accepting their first proposal.

I would welcome a conversation about where the AI roadmap is right now and what the largest open uncertainty is. I am available on four weeks' notice.

Best regards, *Philipp Hilbert*
