

Philipp Hilbert. *Product Manager who ships in feedback loops, not slide decks.*

Positioning, ten years building B2B SaaS end-to-end – from regulated enterprise platforms to AI data systems – for teams that need clarity, not process.

Alasco is building software for a domain where the stakes are high, the workflows are genuinely complex, and the users – investment managers, construction controllers, financial planners – have spent years managing decisions with tools that were not built for them. That is not a positioning statement I take at face value; it is a product challenge I recognise from experience.

At Rohde & Schwarz I built a central AI and data management platform for a European defence programme. The users were data scientists and ML engineers who needed curated, auditable, reproducible datasets. The challenge was not the technology – it was understanding their actual workflows, surfacing the assumptions behind existing processes, and translating that into requirements the engineering team could act on with confidence. I delivered autonomous feature sets end-to-end, including a GitOps-based rollout that reduced deployment times from several days to under forty minutes. At the Federal Employment Agency I owned the Arbeitsmarktmonitor, an analytics platform for regional labour market data, where I served simultaneously as product manager, Deputy IT Security Officer, and the person responsible for migrating legacy infrastructure to Kubernetes – a breadth of ownership that forces exactly the kind of trade-off thinking your posting describes.

What these roles share with the Alasco problem space is complexity that does not simplify cleanly: multiple stakeholder groups with competing priorities, data that needs to be trustworthy before it can be useful, and product decisions made under incomplete information. I am most effective in this kind of environment because I am comfortable holding ambiguity long enough to make good decisions rather than fast ones.

On AI in product work: I use it daily – Claude Code and GPT for spec generation and edge-case analysis, Lovable and Framer for rapid prototyping, n8n and custom agent frameworks for workflow automation. More importantly, I have thought carefully about where AI creates real value for users and where it introduces new failure modes they cannot see. At Rohde & Schwarz I worked directly on SafeAI and ExplainableAI concepts for ML training pipelines – not as a

theoretical exercise but as a product requirement for a stakeholder group that needed to trust the outputs before they would act on them. That experience maps directly to the evaluation criteria, feedback loops, and user-facing guidance your posting specifically calls out.

I speak German natively and English at C2 level. I am open to relocating to Munich. I am genuinely interested in what Alasco is building, and I would welcome a conversation about how I could contribute.

Best regards, *Philipp Hilbert*
