Dear Longevium team,

You are building something that does not yet exist in a clean form: a platform where a patient can find, compare, and book a longevity diagnostic program the same way they book a flight, without a phone call, without a broker, and with payment handled in the same flow. That is a genuine product problem, and the job description is honest about what it requires: someone who builds the first version themselves rather than writing specifications for a team that does not exist yet.

That description matches the work I have been doing for the past decade. At Kvitt Payment Solutions I took a mobile P2P payments product from zero to acquisition into the Sparkasse girocard ecosystem. At CLINET Platforms I led a five-person team in a hospital-piloted patient app, integrating CompuGroup Medical's KIS interface and cutting digital anamnesis time from 30 minutes to 5. At construct8, my most recent venture, I built a two-sided B2B marketplace alone, clinic-side supplier onboarding, an anonymity-until-payment model, LLM agents running the operational funnel, and got to live bookings without a team. The Longevium brief is structurally the same problem: connect supply (clinics, doctors, programs) with demand (patients), close the payment loop, and do it fast enough to learn before you spend.

On the tooling side, I work daily with Claude Code, Lovable, GitHub Copilot, and n8n for agentic workflow automation. I do not need a developer to build a working prototype; I ship it myself and use the result to have a real conversation with a clinic partner or a user rather than a hypothetical one. The Codex and Lovable experience the posting calls out as a strong advantage is part of my standard workflow.

The one gap I will name honestly: I have not shipped inside the longevity-travel vertical specifically. What I have shipped is the surrounding infrastructure, regulated health workflows, payment trust layers, supplier onboarding on a two-sided platform, and the operational discipline to know when to automate and when to leave something manual until the pattern is clear. That judgment is what makes the difference between an MVP that teaches you something and one that costs six months to unwind.

I would welcome a short call to talk through the platform's current state and where the first bottleneck sits. I am available at four weeks' notice and can work remotely or relocate.

Best regards, *Philipp Hilbert*
