

Philipp Hilbert. *Platform product manager for hospitality SaaS.*

Positioning. I build the platform layers that every other product depends on, APIs, shared services, data consistency, and I have done it in production across B2B SaaS and regulated industries.

Dear Mapal team,

I have spent 13 years as a Product Manager and Product Owner in B2B SaaS and regulated industries, and a consistent thread through that work has been platform products: the shared data layers, the integration points, and the internal services that make everything else possible. The role for MoS caught my attention because it is one of the harder PM jobs, you serve other product teams rather than external users, and success is measured in multiplied velocity across the whole suite, not in a single product metric.

At Rohde & Schwarz I owned the internal AI and data platform for the FCAS programme. That meant designing the shared services and data pipelines that 15+ engineers and data scientists across multinational teams depended on daily. I moved rollout from days to 30 minutes by championing GitOps with ArgoCD, and I increased pipeline runs by 200% by redirecting the roadmap based on instrumented workflow analysis rather than assumption. The problem space is structurally the same as MoS: invisible infrastructure, high blast radius, and other teams as the primary stakeholder.

At Bundesagentur für Arbeit I owned a national labour-market analytics platform from the data layer up, ETL migrations, containerisation, CI/CD pipeline work, and a full UI relaunch running in parallel. I introduced Dagster and dbt to cut the time per data update by roughly 75%, and I migrated the system from bare metal to containers so the team owned its own environments. That kind of data consistency and interoperability work is exactly what MoS needs as Mapal scales.

I understand APIs, system architecture, and data modeling well enough to have genuine technical conversations with engineering, not just to relay requirements. I have shipped shared services, authentication patterns, integrations, notification flows, across several of these roles, so I can translate architectural needs into product goals without an intermediary.

Hospitality operations at scale is a new domain for me, and I would spend the first weeks learning how the individual Mapal products use MoS in practice before touching the roadmap. That is my standard approach: spend a little to learn before spending a lot to build.

I would be glad to talk through how my background maps to the MoS roadmap in more detail.

Best regards, *Philipp Hilbert*
