

Philipp Hilbert. *Senior Product Owner for data platforms.*

Positioning. I turn business questions into data platform roadmaps, ship through cross-functional Agile teams, and keep the backlog anchored to outcomes rather than outputs.

Dear SysMap Solutions team,

I have spent 13 years as a Product Owner and Product Manager, and the last several years specifically inside data and analytics platforms. The Senior Product Owner, Data role at SysMap is a strong match for where my experience sits.

At the Federal Employment Agency I owned a national labour-market analytics platform built on ETL pipelines, Dagster, dbt, and PostgreSQL. I introduced automated pipeline runs so that quarterly data imports and new indicators no longer required hand-holding, cutting time per data update by close to 75%. I also carried a full ETL migration and a containerised infrastructure move through the same period, working across Data Engineering, Analytics, and the broader organisation. That is the kind of cross-functional data platform ownership your posting describes.

At Rohde & Schwarz I was Product Manager for an internal AI and data platform for the FCAS European programme. I led a cross-functional team of 15+ engineers and data scientists through Scrum, managed the backlog in Jira and Confluence, and ran discovery that redirected the product strategy: pipeline usage increased 200% after I shifted from UI-led to developer-code-first design based on workflow instrumentation. Translating business needs into clear requirements for technical teams, and then tracking the results, was the core of the job.

Your posting asks for knowledge of Data Platforms, Data Lakes, Data Warehouses, and GCP. My production experience covers ETL pipelines, Dagster, dbt, containerised data environments, and Kubernetes. GCP-specific services are the one area I would be ramping on, but the architectural thinking transfers directly and I move quickly in cloud-native environments.

I write tight user stories and epics, facilitate discovery workshops, run Scrum ceremonies, and keep stakeholders aligned across departments and seniority levels. I would be glad to bring that to the SysMap data platform team.

Best regards, *Philipp Hilbert*
