---

Dear Current AI team,

I am applying for the Head of Product role. I have 13 years of product ownership across regulated, high-stakes environments, defence AI, public-sector analytics, insurance, healthcare, and fintech, and I am now looking to apply that experience where the stakes are societal rather than commercial.

What draws me to Current AI is the specific challenge of AI Potluck: building a public-interest AI stack that is interoperable by design, not just as an afterthought. At Rohde & Schwarz I drove the AI and data platform for the FCAS European programme, coordinating a cross-functional team of 15+ engineers and data scientists across multinational partners. The constraint there was not technical, it was alignment. Getting distributed teams, external partners, and internal leadership to agree on a shared roadmap is exactly the work this role describes, and I know how to do it. I also know that beautiful roadmaps mean nothing if usage does not follow: at Rohde & Schwarz I instrumented two competing workflows and found that the UI-led one recorded exactly zero clicks. I redirected strategy around that finding, and pipeline runs increased 200%.

On the AI-native side, I build with Claude Code, GitHub Copilot, Cursor, Lovable, and n8n daily. I have written user stories that went straight into implementation, run agentic workflows across a full product funnel, and shipped front-end prototypes without a dedicated engineering resource. This is not aspirational, it is how I currently work. Setting the vision for AI coding-tool use while preserving human judgment in critical product decisions is a line in the job description I could have written myself.

The Public Router's developer use cases are a product surface I find interesting. Routing logic, partner API design, interoperability constraints, and ecosystem completeness are hard problems with real tradeoffs. I have owned technically complex platform products before, at the Bundesagentur für Arbeit I migrated a bare-metal national analytics platform to containers, introduced Dagster and dbt for ETL, and saved roughly 75% of the time per data update, all while keeping the platform available to policymakers. That is the kind of unglamorous but high-leverage infrastructure work that underpins everything else.

I would like to talk about the 2027 roadmap and what "everyday use inside partner organisations" looks like for Alpha in practice.

Best regards, *Philipp Hilbert*
