

Philipp Hilbert. *Product Manager for regulated identity infrastructure.*

Positioning, I have 13 years shipping B2B products in regulated industries, and the Reusable KYB domain sits squarely in that space.

Dear Sumsb team,

I am applying for the Product Manager (Reusable KYB) role. I have 13 years of B2B product ownership in regulated industries, insurance, public-sector analytics, defence AI, healthcare, and fintech, and the Reusable KYB domain maps closely to work I have done before.

At EMIL Group I built and shipped a claims platform from concept to production for an insurance SaaS serving brokers, underwriters and reinsurers. The core challenge was the same one Reusable KYB faces: taking a complex regulated process, understanding where business customers get stuck, and turning that into a product that actually reduces their operational load. At Bundesagentur für Arbeit I owned a national data platform as deputy IT security officer, which meant working directly with compliance constraints, data trust requirements, and multi-stakeholder sign-off, the same dynamics that govern identity and business verification products.

The technical side of the role is comfortable territory for me. I work daily with REST APIs, have shipped products on top of microservice architectures, and have owned products where tokens, webhooks, and backend data flows were central to how the product worked rather than incidental to it. I also have eight years of hands-on crypto experience, which gives me practical context for the VASP and Travel Rule dimensions of the roadmap.

What draws me specifically to this posting is the product challenge of bridging Reusable KYC mechanics into KYB. The two verification domains share structural similarities but diverge in ways that matter: entity hierarchies, beneficial ownership, document refresh cycles, and the reliance model that lets one check serve multiple counterparties. I have read enough of the GLEIF and eIDAS 2.0 landscape to know where the hard problems sit, and I want to work on them with a team that is serious about solving them at scale.

I run discovery continuously, not as a quarterly ceremony, and I measure success by adoption and customer outcome rather than features shipped. That is the standard I would hold this product to.

Best regards, *Philipp Hilbert*
