Dear Tagus Labs team,

I have followed the Liquid Staking and Liquid Restaking space closely for several years, not as a spectator but as an active participant. I trade and manage assets across Hyperliquid, Jupiter, 1inch, and Across Protocol, work with liquidation heatmaps on Coinglass and Hyblock Capital, and have spent years studying execution quality, protocol incentives, and the infrastructure that makes DeFi usable at scale. I also bring 8 years of crypto and DeFi product experience, including work on L2 protocols. When I read your job description, the overlap was hard to ignore.

What Tagus Labs is building is technically demanding. Liquid Staking and Liquid Restaking products live at the intersection of smart contract design, tokenomics, user trust, and market dynamics. Getting the product wrong here has real financial consequences for users. That demands a PM who can read the protocol docs, challenge engineering assumptions, and still translate everything into a roadmap the whole team can execute against. That is what I have done in every complex environment I have worked in, from an AI and data platform for the FCAS European defence programme, where I managed 15+ engineers and data scientists through Scrum in Jira, to a national labour-market analytics platform at the Federal Employment Agency, where I owned a full ETL migration and a UI relaunch simultaneously.

In each of those roles, I started by instrumenting what was actually happening rather than trusting assumptions. At Rohde & Schwarz, I ran two competing workflows side by side and found that the UI-led design recorded exactly zero clicks, redirecting the strategy increased pipeline runs by 200%. At CLINET Platforms, I cut a roadmap a five-person team could not deliver down to the top 10% of features: user acceptance rose more than fivefold. The pattern is the same: measure first, then decide, and keep the outcome in view rather than the output.

On the Web3 side, I actively use and analyze the product layer: DEX aggregation, cross-chain bridging, perpetual futures, and the stablecoin and custody infrastructure underneath. I build my own dev agent framework, a backtest engine for crypto markets, and trading bots. I am not interested in token prices alone, I am engaged with the systems, incentives, and operational mechanics that make digital asset markets function. That is the mindset you need to ship a Liquid Staking product that users actually trust.

I would welcome a conversation about how I can contribute to the Tagus Labs roadmap.

Best regards, *Philipp Hilbert*
