

Philipp Hilbert. *Lead Product Manager, trading and financial infrastructure.*

Positioning, I have shipped regulated fintech products from zero to production, and I know how to read a spec, argue a position, and carry a decision through delivery.

Dear Trading 212 team,

I am applying for the Lead Product Manager role. I have spent 13 years shipping products in regulated industries, fintech, defence AI, public-sector analytics, insurance, healthcare, and the work you describe in this posting is the kind I do best: reading the regulation yourself, forming a position before Legal weighs in, writing a spec that engineering can build and test from, and owning the outcome.

The closest thing I have to the trading and execution area in your job description is my fintech background. I founded Kvitt Payment Solutions, a mobile P2P payments product that was acquired by Sparkasse and operated inside the girocard ecosystem. I have spent years as an active crypto trader across centralised and decentralised venues, Hyperliquid, Bitget, Jupiter, 1inch, Across Protocol, and I work regularly with execution concepts like slippage, price impact, routing and market microstructure. That is not just user-level familiarity; I have built a backtesting engine and algorithmic decision frameworks for crypto markets, and I spend real time with liquidation heatmaps and tools like Coinglass and Hyblock Capital.

On the data side: at the Bundesagentur für Arbeit I owned a national labour-market analytics platform. I queried the data myself, introduced Dagster and dbt to automate quarterly imports, and cut the time per data update by almost 75%. At Rohde & Schwarz I instrumented two competing product workflows to decide which one to build, the beautiful UI-led one recorded exactly zero real clicks, and redirecting strategy based on that data increased pipeline runs by 200%. I bring my own numbers and I can explain every figure I quote.

The payments area you list, onboarding, client money, cards and FX, maps to work I have done at multiple points: Kvitt's P2P payment flows, the procurement webshop I ran for AOK across three insurers and 20,000 employees, and the client-trust and compliance work at EMIL Group where I restructured an 18-person delivery organisation and shipped the Claims Center from concept to production. The pattern across all of those is the same: complex operational workflow, regulatory weight, cross-functional alignment, and a spec detailed enough that nothing breaks at the edges.

I use AI in product work daily, Claude Code for specs and edge-case generation, Cursor and GitHub Copilot in the codebase, n8n for agentic automation, but I check everything against documentation and data before it leaves my hands. I am ready to talk through any of these projects in detail, including where they broke.

Best regards, *Philipp Hilbert*
