Dear CNTXT AI team,

I am applying for the Product Manager role. I have 13 years of product ownership across B2B SaaS, FinTech, HealthTech, insurance, and defence AI, and I want to bring that experience to an AI-native product company where the problems are still being defined.

The description mentions driving A/B testing, user research, and feedback loops to validate product decisions. That is the core of how I work. At EMIL Group I restructured a struggling 18-person delivery organisation into three focused teams, shipped the Claims Center from concept to production, and cut the time to launch a new insurance product from months to under a week. At Bundesagentur für Arbeit I introduced Dagster and dbt into a national labour-market analytics platform and reduced data update time by 75%. Both outcomes started with discovery, understanding what was actually blocking people, before touching the backlog.

I work comfortably across the full SaaS product lifecycle: writing specifications and user stories in Jira and Confluence, running sprint ceremonies in Scrum, designing flows in Figma, and reading the data in Matomo or SQL to decide what to do next. I also write and read code, which means I can pressure-test a technical spec with engineers rather than just hand it over. At Rohde & Schwarz I instrumented two competing product workflows and used the data to redirect strategy, pipeline runs increased 200%.

CNTXT AI is building in a domain where the tooling and user expectations are changing faster than most roadmaps can track. That is a product environment I find interesting, and it is where close collaboration between PM, engineering, and design matters most. I have run that motion in regulated industries where the cost of a wrong decision is high, and I want to do it here.

I would be happy to walk through any of the projects above in more detail.

Best regards, *Philipp Hilbert*
