

Philipp Hilbert. *Supply-side product owner for a healthcare marketplace.*

Positioning, ten years of hands-on product ownership across regulated platforms, mobile apps, and AI-driven systems – now ready to own the doctari App and the professionals who depend on it.

Dear doctari team,

I am applying for the Product Owner role on the supply side of the doctari marketplace. The framing in your job description – full ownership of the doctari App, short decision paths, and active AI integration – maps directly to how I have worked across the last decade, and the healthcare context is one I have navigated before.

At CLINET Platforms, I built a mobile-first hospital app across iOS and Android, integrating CGM interfaces into hospital information system workflows and delivering patient-facing features including digital anamnesis, transport coordination, and document storage. The constraints of that environment – legacy APIs, external databases, clinical staff who have no tolerance for friction at the start of a shift – gave me a clear understanding of what it takes to earn and keep trust from healthcare professionals. That user group is exacting. They will abandon a product the moment it adds steps instead of removing them. Supply-side retention on a marketplace serving that group lives or dies on exactly that insight.

My broader product experience covers regulated B2B SaaS (Emil Group's InsurTech platform), AI data management platforms in a multinational defence programme (Rohde & Schwarz, FCAS), and public analytics infrastructure at the Federal Employment Agency. Across those environments I have owned full product development lifecycles – discovery, backlog management, sprint discipline, delivery, and post-release metric review – and have rebuilt team delivery cadence in organisations where it had broken down. At Emil Group I split a 17-person team into focused Scrum units, reintroduced velocity tracking and structured refinement, and brought a prototype-stage client relationship back to stability through weekly product workshops.

On AI integration specifically: this is not an aspiration for me, it is my current working mode. I use Claude Code, GitHub Copilot, Lovable, and n8n daily for prototyping, spec generation, and autonomous workflow automation. At Rohde & Schwarz I owned a central AI data management

platform with SafeAI and ExplainableAI requirements and delivered autonomous feature sets end-to-end including GitOps rollout. I can translate between an engineering team's architectural constraints and a product vision that includes AI features, because I have worked on both sides of that boundary.

I am a native German speaker, fluent in English, based in Berlin, and available within four weeks of an offer. I would welcome a conversation about the supply-side roadmap and where the highest-leverage work sits right now.

Best regards, *Philipp Hilbert*
