

Philipp Hilbert. *Trust infrastructure PM who has shipped data provenance at scale.*

Positioning, product manager with a decade of technical depth and a track record in AI data governance, security products, and regulated platform delivery – ready to do it again for AI agent trust.

Dear Affinidi team,

The job description for this role describes a problem I recognise precisely: organisations that have promising AI systems but cannot move them to production because trust, governance, and verifiable accountability are not built into the infrastructure. At Rohde & Schwarz, I spent over a year inside that exact gap – on the FCAS European defence programme, I owned a central AI data management platform where the core challenge was not building ML capability but making ML trustworthy: reproducible pipelines, full data provenance, SafeAI and ExplainableAI evaluation concepts, and audit trails that multinational stakeholders could actually rely on. The vocabulary in your description of Trust Fabric – verifiable identity, policy guardrails, real-time observability – maps directly to the product problems I was solving there.

What I bring to a role like this is a combination that is harder to find than either half alone: genuine technical depth and genuine product discipline. At Rohde & Schwarz I unblocked infrastructure-level issues in OpenShift independently and delivered in one week a feature the project lead had been requesting from engineers for over a year. At the Federal Employment Agency I served as Deputy IT Security Officer while simultaneously owning the product roadmap for a public analytics platform, running ETL modernisation with Dagster, and migrating legacy systems to Kubernetes. At Qcrypt AG, as a co-founder and Product Owner, I owned a quantum-resistant encryption product from architecture through to customer-ready packaging – with a stated goal of setup under two minutes and no technical knowledge required. Security products that non-experts can actually use is a design constraint I have worked under before.

Your emphasis on being developer-obsessed resonates. The most consequential product decisions I have made have come from sitting close enough to implementation to understand the trade-offs: reviewing flows, investigating issues, reading the code when necessary. At Emil

Group, where a prototype-stage InsurTech platform had lost client trust and was haemorrhaging senior engineers, I regained both by running structured weekly product workshops and rebuilding sprint discipline from the ground up – while also splitting a bloated 17-person team into smaller units with clear ownership. That kind of work requires technical credibility and stakeholder communication in roughly equal measure.

I am based in Berlin and genuinely interested in the domain. The shift from centralised identity to decentralised, verifiable credentials for AI agents is one of the more interesting structural changes happening in the infrastructure layer right now, and Affinidi is positioned at an interesting point in that transition. I would welcome the conversation.

Best regards, *Philipp Hilbert*
