

Philipp Hilbert. *Trading product leader who knows the stack beneath the orderbook.*

Positioning, ten years shipping regulated fintech and data platforms, now ready to own the trading ecosystem at FundedNext end-to-end. ≤ 25 words.

Dear Hiring Team at NEXT Ventures,

FundedNext's model of performance-based capital, putting real money behind 220,000 traders who have proven they can manage risk, is a fintech product problem at a scale most PMs never encounter. Every platform decision, from how quickly a payout clears to how clearly a drawdown limit is surfaced, has direct financial consequences for real people. That accountability is what drew me to this posting.

My ten years in product span the regulated, the technical, and the operationally complex: payment systems at Scheidt & Bachmann where a missed edge case meant a misfuelled truck; national health-data pipelines at the Bundesdruckerei and Bundesagentur für Arbeit where compliance was not a checkbox but a hard gate; and a defence AI platform at Rohde & Schwarz where rollout time went from days to thirty minutes precisely because the engineering and delivery model was rebuilt from the product layer. None of those were easy environments, and none tolerated vague requirements or untested assumptions, skills that transfer directly to a brokerage ecosystem where regulatory alignment and high-stakes execution happen simultaneously.

Beyond the professional record, I trade actively across centralized and decentralized venues, Hyperliquid, Bitget, Jupiter, 1inch, Across Protocol. I work with liquidation heatmaps on Coinglass and Hyblock Capital, study execution quality and slippage dynamics, and have built backtesting tooling and algorithmic decision frameworks for my own crypto strategies. I understand what a trader needs from a platform not because I have read a report about it, but because I live on one daily.

On the AI fluency the role requires: I run production workflows with Claude Code, GitHub Copilot, and n8n-based agent loops, and I have built a file-queue-driven agent framework of my own. I can sit in a technical conversation with an engineer about API architecture or agent orchestration and push back when a proposed approach is over-engineered for the actual use case, which is precisely the feasibility judgment your job description calls out.

My working style is low-ego and outcome-oriented. I negotiate metrics before anyone writes a line of code, run discovery continuously rather than as a phase, and hand engineers a problem with enough context to own it. At NEXT Ventures I would bring that same discipline to the trading product backlog from day one, starting by mapping the MT5/cTrader integration surface, identifying where user friction and compliance risk intersect, and shipping the first improvement in weeks, not quarters.

Best regards, *Philipp Hilbert*
