

Philipp Hilbert. *Consumer trading PM with a live crypto stack.*

Positioning, ten years of product delivery in regulated, data-heavy environments, now applied to a consumer trading platform where the candidate trades and builds on every day.

Dear Kraken Consumer Trading team,

I have been a retail crypto user for eight years. I trade perpetuals on Hyperliquid, route spot through Jupiter and 1inch, bridge via Across Protocol, and track liquidation clusters on Coinglass and Hyblock Capital. I am not describing a hobby; I am describing the user you are trying to serve, and the lens I would bring to every prioritisation call. When a feature debate gets abstract, I can close it with a screen recording of my own session on the product.

The job description asks for someone comfortable prototyping with Claude Code and Cursor before writing specs. This is already my default mode. At construct8, a disputed onboarding flow became a working prototype in a single afternoon, tested with real tradespeople before any engineer opened a ticket. At Rohde & Schwarz, I used the same approach on a defence AI data platform to reframe a UI-heavy product into a dev-code-friendly interface, cutting rollout time from days to thirty minutes. The tool changes; the discipline of resolving uncertainty with the cheapest possible instrument before committing engineering capacity does not.

Kraken's consumer surface, spot, staking, xStocks, futures, OTC, is exactly the kind of cross-asset complexity that rewards a PM who understands the mechanics underneath. I actively trade across CEX and DEX venues, study slippage, price impact, and market microstructure, and I am developing a personal backtesting engine for crypto strategies. This is not background knowledge; it is ongoing practice that keeps my product instincts calibrated to what retail traders actually experience, not what they say in surveys.

On the operational side, the role requires close collaboration with Finance and Operations to maintain business continuity, a pattern I know from Bundesdruckerei (RKI's national health data platform, identity management, the highest privacy requirements) and from Scheidt & Bachmann (POS and payment systems in a SAFe programme with PI planning and release trains). Regulated, high-stakes, cross-functional. The compliance and continuity muscle is already trained.

I would be glad to walk through a specific feature proposal, a discovery framework, or a prototype, whichever gives you the clearest signal on fit.

Best regards, *Philipp Hilbert*
