

Philipp Hilbert. *Senior AI Product Manager bridging enterprise technology and measurable outcomes.*

Positioning, ten years delivering B2B digital products from discovery through launch, now applying an AI-native working method to build enterprise and government products that create tangible value.

To the hiring team at Halian,

The role you have described, an AI Product Manager who owns product definition for enterprise and government clients, bridges business and engineering, and leverages AI tools to accelerate delivery, is precisely the position I have been building toward across a decade of product work in regulated, high-stakes environments. I would like to make the case that I can step into this role and contribute from day one.

The central challenge in AI product management is not knowing which models to use. It is knowing when to use AI at all, how to evaluate its limitations honestly for a given business problem, and how to translate that evaluation into a product decision a government stakeholder or enterprise client will trust. At Rohde & Schwarz, I owned the product for a defence AI training data platform under the FCAS programme. That required me to work with multimodal AI pipelines at production scale, define the data provenance and audit requirements that made the output acceptable to defence clients, and steer the product from a UI-heavy architecture to a developer-code-friendly one, a decision that cut rollout time from days to thirty minutes. The technical judgment, the stakeholder communication, and the delivery discipline are all present in that single example.

Client-facing communication with senior and executive audiences is a recurring requirement in this posting. I have run PI planning events and release train reviews at Scheidt & Bachmann, presented public analytics platform strategy to Bundesagentur für Arbeit leadership, and navigated the privacy and identity governance conversations that come with national health data work at Bundesdruckerei. I am comfortable in rooms where the audience is senior, the stakes are high, and the product position needs to be defended with data rather than slides. A spoken English sample is available at youtube.com/watch?v=nt06f71lgfE, a product presentation I gave for Qcrypt AG's quantum-encryption product.

On the AI-native tooling requirement: I use Claude Code, GitHub Copilot, Lovable, and n8n in production workflows, not as experiments. A disputed user flow becomes a clickable prototype inside a day. PRDs and edge-case libraries are generated with LLM assistance and then reviewed for accuracy, not the reverse. This working mode is now part of my current role at construct8, where I am taking a zero-to-one construction marketplace to market using WhatsApp and Telegram APIs alongside LLM agents. The ability to move fast at definition and validation stage, then hand a well-specified product to engineering, is exactly what an AI-native organization needs from a senior PM.

Abu Dhabi is not a compromise location for me. I am actively targeting the UAE and am prepared to relocate on short notice. I understand that enterprise and government clients in the Gulf operate on relationship cadences and communication norms that differ from European markets, and I am genuinely interested in learning that context rather than projecting a European product playbook onto it.

I would welcome a conversation about the specific client engagements and product areas this role will focus on.

Best regards, *Philipp Hilbert*
