

Philipp Hilbert. *Trading product builder who understands the infrastructure beneath the chart.*

Positioning, 10+ years of PM across fintech, regulated data platforms, and AI-native tooling, ready to own the trading product lifecycle at FundedNext from discovery through release.

Dear Hiring Team at NEXT Ventures,

The trading product role at FundedNext caught my attention precisely because it combines two things that rarely appear together in a single job description: the operational rigour of a regulated brokerage environment and an explicit expectation that the PM understands agent frameworks and LLM feasibility at a technical level. That combination describes the work I am already doing.

Over the last decade I have owned product for a defence AI data platform at Rohde & Schwarz, a national health data infrastructure at Bundesdruckerei, a public analytics platform for Bundesagentur für Arbeit, and most recently a zero-to-one marketplace at construct8 where I deliver production features using Claude Code, Lovable, and a multi-agent n8n stack. Across those environments the constant has been cross-functional delivery under real constraints, regulatory, technical, and commercial, not in spite of them. At Rohde & Schwarz I shortened rollout time from days to 30 minutes while steering a multimodal AI data pipeline from a UI-heavy architecture to one developers could extend themselves. At EMIL Group I diagnosed a 17-person team that was shipping slowly, split it into three mission-aligned squads, and launched Claims Center within the same planning cycle.

My crypto background is hands-on and infrastructure-oriented. I actively trade perpetual futures and spot across Hyperliquid, Bitget, Jupiter, and 1inch, study execution quality using Coinglass and Hyblock Capital liquidation analytics, and have built a personal Python backtesting engine to validate strategy ideas before committing capital. I understand slippage, price impact, routing, and market microstructure not as vocabulary but as the mechanics I interact with every week. That background means I can translate between a trading operations team and an engineering team without a glossary in between, which is exactly what the PM role at FNmarkets requires.

On the AI literacy bar: I do not just use these tools, I rely on them for production output. Claude Code is how I resolve in-repo refactors and generate acceptance criteria at scale. I have built file-queue-based agent loops and orchestrated multi-agent workflows in n8n. When an engineer pitches an agentic solution I know which questions to ask and which promises to flag as architecture risk. I will not be the PM who approves an AI feature plan because the diagram looked confident.

I am based in Berlin, available on four weeks' notice, and open to discussing the scope and structure of the role in detail. Thank you for reading this far.

Best regards, *Philipp Hilbert*
