Dear Hiring Team,

I am applying for the Senior Product Owner, Digital Onboarding role at Al Hilal Bank. The posting describes a mandate I have executed in structurally similar environments: own the product vision, decompose it into squad-executable value streams, coach other product owners, and remove the organisational friction that keeps good ideas from reaching customers. The regulated-environment context and the expectation of scaled agile discipline are the exact conditions under which I have done my best work.

At EMIL Group I inherited a seventeen-person team shipping too slowly and with unclear ownership. I split the team into three focused squads with dedicated leads, launched the Claims Center, and created the feedback loops that made performance visible at squad, tribe, and platform level. The structural challenge at Al Hilal, aligning multiple squads in a scaled agile model across a digital banking tribe, is the same problem with a different domain label. At Scheidt & Bachmann I operated inside SAFe's PI planning and release-train model for fuel-retail payment integration, which gave me fluency in the coordination layer that most product owners treat as someone else's problem.

My regulated-environment experience is relevant beyond process compliance. At Bundesdruckerei I owned national health data products under the highest German privacy requirements; at Rohde & Schwarz I stewarded an AI data platform inside the FCAS defence programme, where a misaligned requirement is not a sprint miss but a procurement risk. Those contexts trained a specific discipline: define success precisely before building, and make every product decision falsifiable with data. That habit transfers directly to digital onboarding, where drop-off at each funnel step is a measurable fact, not a matter of opinion.

I work AI-natively: a disputed customer journey becomes a clickable Lovable prototype the same day, so stakeholder alignment happens on a concrete artefact rather than a slide. I use Claude Code and GitHub Copilot to own production code without writing it, which means I can review engineering estimates with genuine fluency rather than deference. For a squad that needs to move fast and stay compliant, a product owner who can read the implementation is a meaningful advantage.

Abu Dhabi and Dubai are active targets for me; I am willing to relocate and work fully on-site. I would be glad to discuss how my background maps to the specific onboarding journeys Al Hilal Bank is building.

Best regards, *Philipp Hilbert*
