Dear dubizzle Hiring Team,

Funnel ownership sits at an uncomfortable intersection: it requires the analytical discipline to read a drop-off curve without jumping to conclusions, the product craft to turn a hypothesis into a clean experiment, and the cross-functional range to align CRM, design, and engineering on a shared north-star before anyone writes a line of code. I have spent the last several years doing exactly that, not always in a classifieds context, but always in environments where the wrong conversion assumption costs real money.

At EMIL Group I inherited a monolithic insurtech team of seventeen people producing slow output and unclear ownership. I split it into three nimble teams with designated leads, negotiated outcome-based metrics with stakeholders, and launched the Claims Center product, a funnel in its own right, where a user in distress has to move from first notice of loss to resolved claim without abandoning the flow. That work required session-level analysis of where users stopped, iterative CTA and form changes, and tight coordination with the insurer partner on what a qualified lead actually meant downstream. The mechanics are identical to what dubizzle needs across its VAS funnels.

At Bundesagentur für Arbeit I owned the public analytics platform from a bare-metal server environment to a containerised, filterable, social-media-ready data product. The growth challenge there was discoverability and engagement, getting labour-market data in front of journalists, researchers, and policy teams who had no prior habit of using the platform. I ran the ETL migration, the UI relaunch, and the instrumentation in parallel, which taught me that funnel health dashboards are only as reliable as the event taxonomy underneath them. I would bring that same pipeline-level rigour to GA4 and GTM instrumentation at dubizzle.

The VAS scope, inspections, financing, insurance, evaluations, service contracts, maps closely to the insurtech and e-commerce work in my background. I have shipped inside regulated partner environments (insurers, public bodies, defence contractors) where the approval criteria and operational constraints of the integration partner shape what is feasible more than the engineering timeline does. I am familiar with that negotiation, and I know how to scope a bank or insurance partner integration so it ships rather than stalls in a procurement queue.

My working mode is AI-first: a disputed flow becomes a clickable Lovable prototype in a day; I do not write the production code, I own it end-to-end. That compresses the discovery-to-decision cycle significantly and means I can show CRM and Marketing a working mockup of a re-engagement flow before asking engineering to estimate it. I look forward to bringing that approach to dubizzle's growth agenda.

Best regards, *Philipp Hilbert*
