Dear SAI360 Hiring Team,

I am writing to apply for the Senior Product Manager role at SAI360. With 13 years of product ownership in regulated B2B SaaS environments, spanning insurance, public-sector analytics, healthcare, and defence AI, I have spent my career doing exactly what the posting describes: combining continuous discovery with empowered cross-functional teams to deliver outcomes that are valuable, viable, feasible, and usable.

Your description of the role resonated with me because it is not asking for a feature-writer or a project coordinator. It asks for someone who can own product strategy, run real client discovery, lead go-to-market coordination, and drive prioritization with data-backed rigor. At EMIL Group I restructured an 18-person delivery organization into three lean, accountable teams after it was losing senior engineers and client trust; attrition dropped from near-total to a single departure, and I shipped the Claims Center from concept to production in the same period. At Bundesagentur für Arbeit I owned a national labour-market analytics platform, integrated Dagster and dbt to reduce data update effort by roughly 75%, and served concurrently as Deputy IT Security Officer, a combination that gave me a clear picture of how compliance and data governance constraints shape product decisions at the platform level.

The GRC and Ethics & Compliance domain is one I can engage with seriously. Risk-first product discovery, framing every initiative against value, usability, feasibility, and business viability risk before committing engineering capacity, is not a technique I apply occasionally; it is the mental model I default to. I have worked in environments where the cost of a wrong decision is measured in regulatory exposure or patient safety, and that context sharpens prioritization in ways that standard feature-velocity metrics do not.

On the AI tooling dimension: the posting calls out rapid prototyping through AI as a core expectation, not a nice-to-have. I use Claude Code, Lovable, GitHub Copilot, and Cursor daily, not as productivity shortcuts, but as a way to compress the feedback loop between a hypothesis and a testable artifact. At Rohde & Schwarz I redirected an entire platform strategy based on instrumenting two competing workflows; the AI-native working style means I can do that kind of rapid validation without waiting for a design sprint to be scheduled.

I am based in Berlin, fluent in both German and English, and already accustomed to global virtual teams spanning the US, Europe, and India. I would welcome the opportunity to discuss how my background maps to SAI360's current product priorities.

Best regards, *Philipp Hilbert*
