Dear DataDome team,

I am applying for the Senior Product Manager role focused on the DataDome platform and customer lifecycle. Your expanded mission, managing not just bot traffic but the intent of every session from human visitors to AI agents, is exactly the kind of inflection point that produces the most interesting platform problems, and the description of this role maps closely to work I have done repeatedly across B2B SaaS, data platforms, and regulated infrastructure.

The core challenge you have described is one I recognise: a product that has grown from a focused security tool into a full traffic control plane now needs a platform layer that makes it coherent for customers to adopt, configure, and expand without white-glove support at every step. At EMIL Group I inherited an 18-person delivery organisation losing senior engineers and client trust simultaneously. I restructured it into three focused teams, shipped the Claims Center from zero to production, and cut new insurance product launch time from months to under a week, all while the platform's underlying architecture was being stabilised. The throughline was the same discipline this role requires: clear trade-offs between near-term customer value and long-term platform investment, aligned across Product, Engineering, and Revenue teams.

At Rohde & Schwarz I owned an internal AI and data platform for the FCAS programme, multi-team, multinational, technically deep. I used instrumented workflow analysis to redirect the roadmap away from a UI-first approach that recorded zero real usage and toward developer-code-first flows that tripled pipeline utilisation. At Bundesagentur für Arbeit I introduced Dagster and dbt to eliminate manual data-update cycles, saving 75% of the time per release, and migrated the full system from bare-metal to containers so the team owned its own environments. Both cases involved the same fundamentals DataDome needs: shared foundations that reduce manual work, improve reliability, and let the product team move faster rather than slower as the system grows.

Your specific mention of identity, authentication, SSO, RBAC, and developer-facing APIs including MCP and agent access is well-matched to my background. At Qcrypt AG I owned the product architecture for quantum-secure encryption across hardware and software, including the installation model that brought enterprise setup time under two minutes. At Bundesdruckerei I shaped data structures and identity management for Robert Koch Institute programmes. I am fluent in the operational mechanics of entitlements, provisioning, and the security constraints that enterprise SaaS customers require, and I have shipped in environments where those constraints were non-negotiable.

I work best in exactly the kind of environment DataDome describes: technically demanding, cross-functional, outcome-driven, with real ambiguity about what the right next platform investment is. I bring 13 years of product ownership, deep fluency across data, infrastructure, and AI tooling, and a track record of shipping in regulated, high-stakes contexts where reliability and trust are the product. I would welcome the conversation with your Chief Product Officer and the product case discussion.

Best regards, *Philipp Hilbert*
