Dear Zeely team,

Zeely's stated direction, building a marketing agent that receives a business goal and executes it autonomously rather than waiting for the user's next click, is exactly the product problem I find most compelling right now. Most "AI-powered" tools in the marketing space are glorified form generators. What you are building is categorically different: a system with its own decision layer. I want to work on that.

My most relevant recent work is at construct8, a two-sided staffing marketplace I built from scratch. The core product decision there was to replace manual coordination work, candidate qualification, matching, follow-up, with LLM agents running across the funnel, so that a single operator could manage what previously required a small team. The mechanics are identical to what Zeely is pursuing: define the task boundary clearly, give the agent the right tools, instrument the handoffs, and iterate on where it loses context. I ran that cycle alone, which means I understand both the product and the implementation deeply enough to work without a gap between PM intent and engineering execution.

At Rohde & Schwarz I owned the AI and data platform for the FCAS European defence programme, leading 15+ engineers and data scientists. The most instructive moment was an A/B test between two competing workflows: a polished UI-led experience and a developer-code-first path. The beautiful one recorded exactly zero clicks. That lesson, that the right agentic interface is often the one that gets out of the way entirely, is one I would bring directly to decisions about Zeely's agent UX surface in web, mobile and Slack.

At EMIL Group I rebuilt an 18-person delivery organisation that was losing engineers and client trust. I restructured it into three lean teams with dedicated leads; attrition fell from near-total exodus to a single departure and we shipped the Claims Center from concept to production without a precedent to work from. I mention this because building the AI agent direction at Zeely is not only a product problem, it is also an organisational one, and I have navigated that before.

The SaaS and AI product experience, the hands-on agentic workflows background, and the data-driven experiment culture you list as requirements are all present in my track record. I would welcome a conversation about how I can contribute to Zeely's agentic-first roadmap.

Best regards, *Philipp Hilbert*
