

Philipp Hilbert. *Protocol Product Manager, DeFi infrastructure.*

Positioning, ten years shipping technical products in regulated and complex environments, now focused on open credit infrastructure at the protocol layer.

Dear Morpho team,

I have been following Morpho's architecture for some time, specifically the design decision to separate the base protocol from the product layer and let external curators and distributors own the risk/reward configuration. That is a structurally different bet from most DeFi lending protocols, and it is the right one if the goal is credibly neutral infrastructure that institutional participants can build on without depending on the protocol team's governance cadence. The role you are hiring for sits at the centre of that bet: keeping the protocol lean, composable, and correctly sequenced while the ecosystem around it grows faster than any single team can directly manage.

My background is in technically complex, regulated, cross-functional environments where the product manager is the person who keeps a distributed group of engineers, researchers, and external stakeholders moving toward the same outcome. At Rohde & Schwarz I ran a cross-functional team of 15 engineers and data scientists building an internal AI and data platform for the FCAS European programme, shipping a GitOps-based rollout that cut deployment time from days to 30 minutes and made the platform hotfix-capable without a change-freeze window. At the Bundesagentur für Arbeit I carried a full UI relaunch, a container migration, and an ETL overhaul through the same cycle by being explicit about sequencing and making the dependencies visible before committing to dates. Both situations required reasoning about system constraints and communicating tradeoffs to non-technical stakeholders without losing the technical detail that engineers need to act confidently.

On the crypto and DeFi side: I have been an active participant for eight years, trading and managing assets across centralised and decentralised venues including Hyperliquid, Jupiter, 1inch, and Across Protocol. I work with perpetual futures, DEX aggregation, cross-chain bridging, and liquidation analytics as a practitioner, not an observer. I have built a personal backtesting engine to study execution quality, slippage, price impact, routing, and I spend time on market microstructure and protocol mechanics. My interest is in the infrastructure layer: stablecoins, custody, exchange connectivity, and the systems that make digital asset markets function at scale. That is the same layer Morpho operates on, and it means I can have the curator and integrator conversations you need without needing a DeFi orientation period.

The specific ask in your success criteria, to have shipped a meaningful protocol improvement and show how it advanced user or business outcomes within six months, is one I am comfortable committing to. I work best when success is defined in advance, because it forces a discipline of choosing the right problem before the right solution. At CLINET Platforms I cut a backlog that a five-person team could not deliver to the top 10% of features against agreed measures: user acceptance rose more than fivefold. That trade-off calculus, what to drop so that what remains actually lands, is exactly what the protocol roadmap role requires.

I am in Berlin, well inside your GMT+2 timezone window, available at short notice, and genuinely motivated by what Morpho is building. I would welcome a conversation.

Best regards, *Philipp Hilbert*
