Dear Outreach team,

Revenue teams generate more behavioral signal than any other part of an enterprise, every call, every email, every forecast update. The hard problem is not capturing it; Outreach already does that. The hard problem is turning it into something a front-line seller can act on, and something a revenue leader can trust enough to change how they run their team. That is exactly the problem I want to work on.

My most directly relevant work was at Rohde & Schwarz, where I led an internal AI and data platform for the FCAS European defence programme. The core challenge was the same one Outreach faces in seller performance: the data existed, the models ran, but adoption was near zero because nobody had instrumented which workflow users actually followed. I ran a structured comparison of two competing interaction patterns, a polished UI-led path and a developer-code-first path, and the UI-led one recorded exactly zero clicks. Redirecting the roadmap on that finding increased pipeline runs by 200%. The lesson was not that the UI was wrong; it was that conviction without measurement is just opinion. I apply that same discipline to AI product decisions: define what "good" means before you build, then check whether you got there.

At the Federal Employment Agency I owned a national labour-market analytics platform used by policymakers and researchers. I integrated Dagster and dbt to bring quarterly data imports under automated control, cutting update time by roughly 75%, and carried a full ETL migration and UI relaunch through the same period without disrupting live users. The platform sits in a public-sector environment with real governance requirements, GDPR, Deputy IT Security Officer accountability, audit trails, which maps directly to the AI governance, privacy, and responsible AI principles Outreach's enterprise customers will require. I am fluent in human-in-the-loop design not as a concept but as a delivery constraint I have scoped and shipped against.

On the agentic AI side: I design and build multi-agent workflows with n8n and Dagster, prototype product surfaces with Lovable and Claude Code, and write my own evaluation loops and prompt architectures. My construct8 side project runs LLM agents across an entire hiring funnel, qualification, matching, and conversion tracking, operated by a single person. I understand the failure modes of agentic systems at the seam between model quality and product experience, and I know when a problem is better solved without AI. The B2B SaaS platform work at EMIL Group, where I shipped the Claims Center from zero to production and cut insurance-product launch time from months to under a week, gives me the cross-functional delivery muscle, engineering, data science, design, marketing, that a platform role at Outreach requires.

I am based in Berlin, work fully remotely, and am available at four weeks' notice. I would welcome a conversation about the seller-performance analytics area specifically, it is the kind of problem where my strengths in behavioral data, AI evaluation, and outcome-driven discovery compound quickly.

Best regards, *Philipp Hilbert*
