Dear noon Talent Team,

I am applying for the Product Lead 1 role on Noon B2B. I have spent 13 years owning product in environments where the complexity is real and the tolerance for vague requirements is zero, defence AI platforms, national public-sector analytics infrastructure, B2B SaaS for insurers, and a two-sided B2B marketplace I built from scratch in construction. The thread connecting all of them is the same challenge noon is facing: translate an ambiguous business problem into a product architecture that engineering can execute and customers will trust.

The Noon Procurement Agent is a genuinely hard product problem. Building an AI-native procurement platform is not a matter of adding a search bar and a recommendation engine. It requires designing trust at every layer: which decisions the agent makes autonomously, which ones require a human approval, where credit and invoicing create failure scenarios that an agent must handle gracefully, and how you evaluate whether the agent's recommendations are actually improving procurement outcomes. I have designed human-in-the-loop mechanisms for AI governance in a regulated defence context (FCAS programme, Rohde & Schwarz) and shipped agentic workflows in my own marketplace. That combination of enterprise trust design and hands-on agent delivery is not common in PM profiles, and it maps directly to what the Noon Procurement Agent needs.

On the execution side, I know what rigorous PRDs look like. At Bundesagentur für Arbeit I owned a national analytics platform where a missed edge case in an ETL migration meant wrong labour-market statistics in front of policymakers. At CLINET I cut a five-person team's roadmap to the top 10% of features by agreeing success measures first and measuring against them, user acceptance rose fivefold. At EMIL Group I restructured an 18-person delivery organisation that was bleeding senior engineers and client trust. These are not portfolio talking points; they are the kind of structural interventions that a Product Lead needs to make, and I have made them under pressure.

I am also genuinely AI-native rather than AI-adjacent. I use Claude Code, GitHub Copilot, and n8n daily for product work, prototyping, requirements generation, agentic orchestration, and I stay current on LLM evaluation, retrieval, latency and cost trade-offs, and the emerging agentic-commerce patterns that will define what noon's B2B platform looks like in two years. I do not need to be convinced that agents will reshape procurement; I am building in that direction already.

Noon's mission to redefine what technology does in the Middle East is specific enough to be credible and ambitious enough to be worth the effort. I am relocating-ready for Dubai and available at short notice.

Best regards, *Philipp Hilbert*
